TITLE	Bibliography of Assessment Alternatives: Mathematics. Innovative Assessment.
INSTITUTION	Northwest Regional Educational Lab., Portland, OR. Test Center.
SPONS AGENCY	Office of Educational Research and Improvement (ED), Washington, DC.
PUB DATE	94
CONTRACT	RP91002001
NOTE	76p.
PUB TYPE	Reference Materials - Bibliographies (131)
EDRS PRICE	MF01/PC04 Plus Postage.
DESCRIPTORS	Classroom Techniques; *Educational Assessment; Educational Innovation; Educational Research; Elementary Secondary Education; *Mathematics Education; Portfolios (Background Materials); *Student Evaluation; *Test Construction; Test Use
IDENTIFIERS	*Alternative Assessment; *Performance Based Evaluation

ABSTRACT

Articles in this bibliography represent holdings of the Test Center of the Northwest Regional Educational Laboratory in the area of assessment alternatives in mathematics. Articles are included to stimulate thinking and provide new ideas. Some of the entries describe formal assessments, intended mainly for the classroom. The 134 annotations center on test construction, and describe a number of approaches, including portfolios and other performance-based assessments. (SLD)

BIBLIOGRAPHY OF ASSESSMENT ALTERNATIVES: MATHEMATICS

August 1994

The following articles represent Test Center holdings to date in the area of assessment alternatives in mathematics. Presence on the list does not necessarily imply endorsement. Articles are included to stimulate thinking and provide ideas. Some of the entries are formal assessments, and are intended mainly for the classroom. For more information, contact Matthew Whitaker, Test Center Clerk, at (503) 275-9582, Northwest Regional Educational Laboratory, 101 SW Main, Suite 500, Portland, Oregon 97204, e-mail: testcenter@nwrel.org. To purchase a copy of this bibliography, please call NWREL's Document Reproduction Service at (503) 275-9519.

Alberta Education. ***Diploma Examinations Program--Mathematics 30,*** **1991. Available from: Learning Resources Distributing Centre, 12360 - 142 St., Edmonton, AB T5L 4X9, Canada, (403) 427-2767, fax (403) 422-9750.**

Alberta Education develops diploma examinations in several course areas. These, combined with school-awarded "marks" are used to assign credit for the courses. The *Mathematics 30* examination has three parts: multiple-choice, "numerical response" (students "bubble" their answers onto the scan sheet), and written response. The test appears to only assess knowledge of the subject area rather than problem solving, communication, reasoning, etc. Examinations are given locally under controlled conditions. Papers are scored centrally. Scoring appears to be based on the correctness of the answer.

The mathematics test covers advanced algebra, geometry, trigonometry, and number theory.

(TC# 500.3DIPEXP)

Alberta Education. *Diagnostic Mathematics Program*, 1990. Available from: The Learning Resources Distributing Centre, 12360 - 142 St., Edmonton, AB T5L 4X9, Canada, (403) 427-2767.

The *Diagnostic Mathematics Program* provides assessment and instructional ideas and materials for five goals areas (numeration, operations/properties, measurement, geometry, and problem solving) at six grade levels (1-6). There are ten handbooks designed for classroom teachers: five goals areas times two levels (grades 1-3 are bound together in the same books, as are grades 4-6). Each handbook contains "observation checklists," "structured interviews," and written tests for several subskills within each skill area. For example, the numeration handbook in grade 3 has separate sections for: place value/whole numbers, decimals, fractions, and ordering whole numbers.

"Observations" require teachers to make a judgment of the skill level (strong, adequate, or weak) of the student in each area to identify those students for whom further evaluation is necessary. Some assistance is given on the criteria for making these judgments.

"Interviews" require students to solve problems or answer questions presented orally. These are the same types of problems as on the written tests. Except for a few problems in the problem-solving handbook, problems are atomistic--each problem is designed to assess a different skill. Except for a few problems in the problem-solving handbook, responses are short answer and are scored right/wrong. Total correct is used to assign a rating of "strong," "adequate," or "weak" for each skill. No rationale is provided for the cut scores given for each rating. In problem-solving, a few problem solutions are scored judgmentally on a scale of 0-2 in three areas: "understanding the problem," "developing and carrying out the plan," and "looking back." A generalized scoring guide is adapted to each specific problem.

No technical information is provided.

(TC# 500.3DIAMAP)

Algina, James, and Sue Legg (Eds.). *Special Issue: The National Assessment of Educational Progress.* Located in: Journal of Educational Measurement 29, Summer 1992.

This special issue of JEM discusses the National Assessment of Educational Progress (NAEP)--history, specification of content and design of assessments for 1992 and beyond, how students are sampled, and how results are reported. Although some articles are somewhat technical, the general pieces on NAEP's history, and the design of current assessments will be interesting to the general readership.

The current plans for math include:

1. Use of calculators for about 70 percent of the test.
2. Estimation skills tasks using an audiotape.

3. Yes/no questions to determine the extent to which students understand the same information when it is presented in different forms.

4. Constructed response questions in which students are asked to document their solutions by drawing their answers, writing explanations, or providing their computations.

Scoring guides for open-ended questions are task-specific. Some examples are provided.

(TC# 150.6JEM292)

Appalachia Educational Laboratory. ***Alternative Assessments in Math and Science: Moving Toward a Moving Target,*** **1992. Available from: Appalachia Educational Laboratory, PO Box 1348, Charleston, WV 25325, (304) 347-0400.**

This document reports on a two-year study by the Virginia Education Association and the Appalachia Educational Laboratory. In the study, 11 pairs of K-12 science and math teachers designed and implemented new methods of evaluating student competence and application of knowledge.

Teachers who participated in the study found that the changes in assessment methods led to changes in their teaching methods, improvements in student learning and better student attitudes. Instruction became more integrated across subjects and shifted from being teacher-driven to being student-driven. Teachers acted more as facilitators of learning rather than dispensers of information.

Included in the report is a list of recommendations for implementing alternative assessments, a list of criteria for effective assessment, and 22 sample activities (with objectives, tasks, and scoring guidelines) for elementary, middle, and high school students, all designed and tested by the teachers in the study.

Most activities have performance criteria that are holistic and task-specific. No technical information or sample student work is included.

(TC# 600.3ALTASM)

Aurora Public Schools. ***Performance Assessments in Science and Mathematics,*** **1992. Available from: Strategic Plan Facilitator, Aurora Public Schools, Department of Instructional Services, 15751 E. 1st Ave., Suite 220, Aurora, CO 80011, (303) 340-0861, fax: (303) 340-0865.**

The author has provided three examples of the types of assessments being developed by teachers in Aurora Public Schools: developing an analogy for the major anatomical and physiological components of a typical eukaryotic cell, recommending a decision concerning the future use of a medical technology in human biology, and collecting and analyzing a data set. These examples, for secondary students, include a description of the task, prerequisite

student experiences, and criteria for judging student performance on the task. Students work in groups of two to four. The assessments are mostly for classroom use.

Performances are evaluated along several dimensions including content, complex thinking, decision making, and collaborative working. Most of the rubrics are task specific and emphasize relative quality. For example, a "4" score for complex thinking on the medical technology task is: "The student clearly and completely identified the criteria by which the alternatives were assessed. The criteria were presented in detail and reflected an unusually thorough understanding and concern for the repercussions of the decision." The collaborative worker rubric is generic and more descriptive; a "4" is "The student expressed ideas clearly and effectively; listened actively to the ideas of others; made a consistent effort to ensure that ideas were clearly and commonly understood; accurately analyzed verbal and non-verbal communications; solicited and showed respect for the opinions of others."

No technical information nor sample student responses are included.

(TC# 000.3SCIMAP)

Badger, Elizabeth. *On Their Own: Student Response to Open-Ended Tests in Mathematics*, 1989-1991. Available from: Massachusetts Educational Assessment Program, Massachusetts Department of Education, 1385 Hancock St., Quincy, MA 02169, (617) 770-7334.

The document we received contained assessment materials for grades 4, 8, and 12 from three years (1988-1990) in four subject areas (reading, social studies, science and math). This entry describes the math portions of the assessments. The 1988 and 1990 materials described open-ended test items in which students had to solve a problem and then explain their answer. In 1988 eight problems were administered to each of the three grades (some problems were repeated between grades). In 1990, ten problems were administered. These problems emphasized the major areas of patterns/relationships, geometry/measurement, and numerical/statistical concepts. All problems were done individually in written format. Problems were distributed in such a way that different students responded to different questions. Responses were scored both for correctness of solution and for quality of the explanation. No specific criteria for judging quality of explanation were given. Many examples of student responses illustrating various conclusions are included.

In 1989, a sample of 2,000 students was assigned one of seven performance tasks (four in math required manipulatives) to do in diads. Each pair was individually watched by an evaluator. Each evaluator could observe between six and ten pairs each day. It took 65 evaluators five days to observe the 2,000 performances. Evaluators were to both check off those things that students did correctly (e.g., measured temperature correctly), and record observations of students' conversations and strategies as completely as possible. A sample checklist of skills includes: measuring, proportional reasoning, equivalency, numeration, attitude, and planning/execution.

Some information on results for all the assessments is provided: percentages of students getting correct answers, using various strategies, using efficient methods, giving good explanations, etc., depending on the task. Many examples of student responses illustrating these various points are provided. No technical information about the assessments themselves is provided.

(TC# 500.3ONTHOM)

Bagley, Theresa, and Catarina Gallenberger. ***Assessing Students' Dispositions: Using Journals to Improve Students' Performance.*** **Located in: The Mathematics Teacher 85, November 1992, pp. 660-663.**

In this article, the authors discuss the use of journals to elicit behavior that can be examined for high school students' attitude toward math, making mathematical connections, and understanding. They present many questions, tasks, and instructions for getting students to self-reflect, and provide good, practical suggestions for managing the process. However, the authors do not provide criteria for examining student responses (i.e., what to look for in responses that are indicators of attitude, connections or understanding), so the procedure is informal. The procedure will only be useful to the extent that users have the expertise to know what to look for in responses.

(TC# 500.6ASSSTD)

Barton, Paul E. ***National Standards for Education: What They Might Look Like; A Workbook*****, 1992. Available from: Educational Testing Service, Policy Information Center, Mail Stop 04-R, Princeton, NJ 08541, (609) 734-5694.**

This monograph presents examples of standards from eight different projects. The intent is to illustrate and document some existing standards, help policymakers sharpen their thinking about standards, and help people develop common concepts of standards. The eight samples come from NCTM Math Standards, Project 2061 in science, Advanced Placement US History, NAEP Science Objectives, Toronto Benchmarks in math and language arts, NAEP Geography Objectives, National Curriculum in England and Wales in math, and Florida Department of Education on general definitions of terms.

(TC# 500.5NATSTE)

Baxter, Gail P., Richard J. Shavelson, Sally J. Herman, Katharine A. Brown, and James R. Valadez. ***Mathematics Performance Assessment: Technical Quality and Diverse Student Impact.*** **Located in: Journal for Research in Mathematics Education 24, 1993, pp. 190-216.**

The authors developed 41 hands-on tasks to measure three categories of sixth-grade student competencies: measurement (seven tasks), place value (31 tasks), and probability (three

tasks). An example of a measurement task is "describe the object" in which students had to write a description of an object that someone else could use to draw the object. Sixteen of the place value tasks were "card shark" in which students were dealt cards with four numbers (e.g., 6000, 100, 60 and 2). They had to put the cards together to form a specified number, read the number aloud, and name the place value of a particular digit. An example of a probability task was "spin it" in which students were given a spinner with eight sections (four orange, three yellow, and one green). They had to predict which color the pointer would land on most or least often, predict the outcome of 32 spins, and carry out the experiment and graph the results.

Responses were scored either by degree of "correctness" or, in the case of the communication items (e.g., describe an object), holistically for general quality of the response. The tasks and criteria were described only in general terms; further information would have to be obtained from the authors in order to actually reproduce the assessment.

Tasks were pilot tested with 40 sixth graders (Anglo and Hispanic) from two types of instructional settings: hands-on and traditional. Results showed: raters using this type of rating scheme can be trained to be very consistent in their scoring; the assessments are costly and time-consuming; a considerable number of tasks need to be administered to provide a reliable estimate of a student's level of achievement; student performances on the hands-on tasks differed by the type of instructional setting (evidence of validity); and there was differential scoring on the part of Hispanics, leading to some equity concerns.

(TC# 500.6MATPEA)

Braswell, James. *Overview of Changes in the SAT Mathematics Test in 1994. [SAT Mathematics--Student Produced Responses]*, 1991. Available from: Educational Testing Service, Rosedale Rd., Princeton, NJ 08541, (609) 734-5686.

This was a paper presented at the annual meeting of the National Council on Measurement in Education, April 5, 1991, Chicago.

Currently, the SAT-Math consists of two parts: regular multiple-choice and quantitative comparison (e.g., solution A is larger than, smaller than, or equal to, solution B, or cannot be determined). A third part called "student-produced responses" will be included on the PSAT in 1993 and the SAT in 1994. In this part, students will solve problems that have integer, fractional, or decimal solutions in the range 0 to 9999. A grid is provided for students to enter their actual answer. Some problems will have more than one right answer or can be any value in a range. For these problems, a correct response is recorded if the student answer is one of the accepted answers. Of the 55-60 items on the test, 10-15 will be in this format.

The materials include a couple of examples of this type of item.

(TC# 500.3SATMAS)

Burton, Grace, Terrence Coburn, John Del Grande, et al. *Addenda Series, Grades K-6: Curriculum and Evaluation Standards for School Mathematics*, 1991-92. Available from: National Council of Teachers of Mathematics, 1906 Association Dr., Reston, VA 22090, (800) 235-7566.

NCTM is producing a series of booklets to support the NCTM Standards. This series provides instructional ideas for grades K-6 for the areas of patterns, geometry/spatial sense, making sense of data, and number sense/operations. They are packaged two ways: by grade level across all subjects, or by subject across all grade levels. It is included here because the exercises might be useful to suggest tasks that could be used in performance assessments.

(TC# 500.5ADDSEK)

Burns, Marilyn. *Math and Literature (K-3)*, 1992. Available from: Math Solutions Publications, Marilyn Burns Education Associates, 150 Gate 5 Rd., Suite 101, Sausalito, CA 94965, (415) 332-4181, fax (415) 331-1931.

The author's premise is that "children's books are effective classroom vehicles for motivating students to think and reason mathematically." This book describes instructional ideas for linking math and literature in grades K-3. Ten lessons are included in their entirety. Twenty-one additional ideas are also provided. Samples of student work are included. The book is included on this bibliography because it might provide ideas for tasks that would be useful in performance assessments.

(TC# 500.5MATLIT) California Assessment Program. *A Sampler of Mathematics Assessment - Addendum - Preliminary Edition*, 1993. Available from: California Department of Education, PO Box 944272, Sacramento, CA 94244.

The *Sampler Addendum* supplements a previous publication (*Sampler*). While the *Sampler* provided an overview of the new assessment system, the addendum provides more detail on the assessments, including scoring guides and scored samples of student work in grades 4, 8 and 10.

(TC# 500.3SAMMAA2)

California State Department of Education. *A Question of Thinking: A First Look at Students' Performance on Open-Ended Questions in Mathematics*, 1989. Available from: California State Department of Education, PO Box 944272, Sacramento, CA 94244-2720, (916) 445-1260.

This report describes the results of 12th grade student assessment using open-ended math problems that were part of the California Assessment Program (CAP). The open-ended problems were scored using rubrics developed for each problem. These rubrics are described, and "anchor" papers for the six scale values for each rubric are provided. Although there is a separate rubric for each problem, they are all intended to reflect the following dimensions of

problem solving: understanding of mathematics, use of mathematical knowledge, and ability to communicate about mathematics.

(TC# 500.3AQUESO)

Carpenter, Thomas P., Elizabeth Fennema, Penelope L. Larson, et al. ***Teachers' Pedagogical Content Knowledge of Students' Problem Solving in Elementary Arithmetic.*** **Located in: Journal for Research in Mathematics Education 19, 1988, pp. 385-401.**

This study investigated 40 first-grade teachers' pedagogical content knowledge of children's solutions of addition and subtraction word problems. Most teachers could identify many of the critical distinctions between problems and the primary strategies that children used to solve different kinds of problems. But this knowledge generally was not organized into a coherent network that related distinctions between problems, children's solutions, and problem difficulty. The teachers' knowledge of whether their own students could solve different problems was significantly correlated with student achievement. The actual instruments used to assess teachers' knowledge are not included in the paper.

(TC# 500.6TEAPEC)

Carpenter, Thomas P., James Hiebert, Elizabeth Fennema, et al. ***A Framework for the Analysis of Teaching and Learning Understanding of Multidigit Numbers.*** **Information on date and availability is unknown.**

This paper presents a way to analyze instruction in math to see whether it is designed to foster understanding, defined as making relevant connections between knowledge. The specific example in the paper relates to multidigit numbers. Dimensions of instruction thought to be critical in promoting understanding include such things as: the scope and sequence of concepts, connections among representations as a basis for establishing meaning for symbols, the nature of problem solving, teacher specification of solution procedures and connections, students' articulation of solution procedures, and coherence between and within lessons.

Most of the paper describes each of these dimensions in detail. Several pages at the end discuss in general terms the kinds of tasks one could give to students to see whether they are making the appropriate connections.

(TC# 500.4FRAANT)

Center for Talent Development. ***Elementary School Pre-Post Survey*** **and** ***Middle/High School Pre-Post Survey,*** **1992. Available from: Evaluation Coordinator, Center for Talent Development, Northwestern University, Andersen Hall, 2003 Sheridan Rd., Evanston, IL 60208, (708) 491-4979.**

This document contains surveys of student attitudes toward mathematics and science. There are two levels--elementary and middle/high school. It was designed for use with Access 2000 participants who are primarily African-American and Hispanic students in an inner-city public school system and enrolled in a math/science/engineering enrichment program.

No technical or contextual information is included.

(TC# 220.3QUEELM)

Champagne, Audrey B. ***Cognitive Research on Thinking in Academic Science and Mathematics: Implications for Practice and Policy.*** **Located in: Enhancing Thinking Skills in the Sciences and Mathematics, Diane Halpern (Ed.), 1992. Available from: Lawrence Erlbaum Associates, Publisher, 365 Broadway, Hillsdale, NJ 07642, (800) 926-6579.**

Although this article is not strictly about assessment, it discusses some topics of relevance to assessment. Specifically, it has a very nice section on the relationship between the tasks given to students and what they can learn. For example, students can't learn as efficiently to integrate knowledge if they are never given tasks that require them to do this. This also has relevance to designing "authentic" tasks for performance assessments.

(TC# 000.6COGRET)

Charles, Randall, Frank Lester, and Phares O'Daffer. ***How to Evaluate Progress in Problem Solving,*** **1987. Available from: National Council of Teachers of Mathematics, 1906 Association Dr., Reston, VA 22091.**

This monograph attempts to assist educators with the challenge of developing new techniques for evaluating the effectiveness of instruction in problem solving by clarifying the goals of problem-solving instruction, and illustrating how various evaluation techniques can be used in practice. Goals include: select and use problem-solving strategies, develop helpful attitudes and beliefs, use related knowledge, monitor and evaluate thinking while solving problems, solve problems in cooperative learning situations, and find correct answers.

Evaluation strategies include: informal observation/questioning and recording results using anecdotal records or a checklist (two are provided); interviews (a sample interview plan is provided); student written or oral self-report of what's happening during a problem-solving experience (a list of stimulus questions is given, as is a checklist of strategies); attitude inventories (two are given); rating scales (three-trait analytic and focused holistic scales are given); and multiple-choice and completion (sample items are given to assess various problem-

solving abilities; many of these parallel question types mentioned by Marshall, below, to assess procedural and schematic knowledge).

Many sample problems are provided. No technical information nor student sample performances are provided.

(TC# 500.6HOWTOE)

Clark, David. *The Mathematics Curriculum and Teaching Program*, 1988. Available from: Curriculum Development Centre, PO Box 34, Woden, ACT 2606, Australia. Also available from: ERIC ED 287 722.

This document was developed to assist classroom teachers in grades 1-6 to improve their day-to-day assessment of mathematics. Content includes: rationale for assessment alternatives in mathematics, instructions for a two-day inservice program using the materials, instructions on how classroom teachers can use the materials without training, and a series of exercises, formats and ideas for classroom assessment.

Assessment ideas include: help with systematically recording information from informal observations using checklists and "folios" of student work, setting-up opportunities for assessment by giving students good tasks to do, assessing problem solving, student self-reflection, and communicating results.

This is written in a very user-friendly manner and contains some good ideas, especially in the areas of designing tasks, problem solving and self-reflection. We found some of the descriptions of activities a little too sketchy.

(TC# 500.3MCTPMA)

Clark, Glenda. *AIM High Math Identification*, 1992. Austin Independent School District Gifted and Talented Program, 211 E. 7th St., Austin, TX 78701, (512) 476-6861.

This set of paper-and-pencil instruments was developed as one of five indicators for placing grade 2-5 students in the Austin Independent School District gifted math program. Each instrument consists of one task to be completed individually by a student. Each task has multiple open-response items associated with it. Responses are scored on a scale of 1-5 using task-specific scoring guides. The document includes one task per grade level, the scoring guide, and student work samples. Not included are technical information or contextual information describing what the assessments are trying to measure.

(TC# 500.3AIMHIM)

Coalition of Essential Schools. [*Various Articles on Exhibitions of Mastery and Setting Standards*], 1982-1992. Available from: Coalition of Essential Schools, Brown University, Box 1969, One Davol Sq., Providence, RI 02912, (401) 863-3384.

Although not strictly about math, this series of articles discusses performance assessment topics and goals for students that are relevant to math. The articles are: *Rethinking Standards; Performances and Exhibitions: The Demonstration of Mastery; Exhibitions: Facing Outward, Pointing Inward; Steps in Planning Backwards; Anatomy of an Exhibition*; and *The Process of Planning Backwards*.

These articles touch on the following topics: good assessment tasks to give students, the need for good performance criteria, the need to have clear targets for students that are then translated into instruction and assessment, definition and examples of performance assessments, brief descriptions of some cross-disciplinary tasks, the value in planning performance assessments, and the notion of planning backwards (creating a vision for a high school graduate, taking stock of current efforts to fulfill this vision, and then planning backward throughout K-12 to make sure that we are getting students ready from the start).

(TC# 150.6VARARD)

Collison, Judith. *Connecticut's Common Core of Learning*, 1990. Available from: Performance Assessment Project, Connecticut Department of Education, Box 2219, Hartford, CT 06145, (203) 566-4001.

The Connecticut Department of Education is developing a series of performance assessments in science and math. Each task has three parts: individual work to activate previous knowledge, group work to plan and carry out the task, and individual work to check for application of learning. This document provides:

1. A lengthy description of one of the ninth grade science tasks: "speeders."
2. Short descriptions of 24 performance tasks in science (8 each in chemistry, physics, and earth sciences), and 18 in math.
3. A group discussion self-evaluation form to be used by students.

No technical information or general scoring guides are included in this document.

(TC# 500.3COSCII)

Collis, Kevin F. and Thomas A. Romberg. *Collis-Romberg Mathematical Problem Solving Profiles*, 1992. Available from: Australian Council for Educational Research Limited, (ACER), Private Bag 55, Camberwell Victoria 3124, Australia, (03) 277-5555, fax: (03) 277-5500. Also available from: ASHE, PO Box 31576, Richmond, VA 23294, (804) 741-8991.

This assessment device for students in grades 2 and 5 has 20 open-ended problems to solve--one problem in each of five areas (algebra, chance, measurement, number, and space) with four questions per problem area. Each question is designed to tap a developmental level of formal reasoning. For example, the "A" question determines whether the student can use one obvious piece of information from the item, while the "D" question determines whether the student can use an abstract general principle or hypothesis derived from the information in the problem.

Responses to each question are scored right/wrong. The number of correct responses on each task determines a developmental level. Suggestions are given for instructional strategies for the various developmental levels. Technical information in the manual includes typical performance for various grade levels, teacher judgment on the developmental level indicated by each task, and additional analyses to show validity of the inferences drawn.

(TC# 500.3COLROM)

Commission on Standards for School Mathematics. *Curriculum and Evaluation Standards for School Mathematics*, 1989. Available from: National Council of Teachers of Mathematics, 1906 Association Dr., Reston, VA 22091.

This book contains standards for curriculum and assessment that attempt to create a coherent vision of what it means to be mathematically literate. This book has been quoted extensively and appears to be the current "standard" for what should be in a math curriculum.

The assessment section covers: three statements of philosophy concerning assessment (alignment, multiple sources of information, and appropriate assessment methods and uses); seven sections on assessing various student outcomes (e.g., problem solving, communication, reasoning, concepts, procedures, and dispositions); and four sections on program evaluation (indicators, resources, instruction, and evaluation team). Each of the seven sections on assessing student outcomes briefly describes what the assessment should cover and provides some sample assessment tasks and procedures.

(TC# 500.5CURANE)

Connecticut State Department of Education. ***Connecticut Common Core of Learning Assessment,*** **1989-1992. Available from: Connecticut State Department of Education, Division of Research, Evaluation, and Assessment, 165 Capitol Ave., Room 340, Hartford, CT 06106, (203) 566-4001.**

This package contains a variety of documents produced between 1989 and 1992. Included are information about: rationale for the assessment, Connecticut's Common Core of Learning (student learning objectives), development process, several sample tasks and scoring mechanisms, student and teacher feedback forms, summaries of student and teacher feedback on the assessments using these forms, a process for developing performance tasks, a survey for student attitudes about science and mathematics, and an example of concept mapping as an assessment tool.

There appear to be two kinds of tasks: complex group projects and shorter on-demand tasks covering individual skills. The projects attempt to get at application and extension of knowledge and concepts. They require some individual and some group work and extend at least over several days. The on-demand portion covers knowledge and it's application in limited situations. Performances are scored for group collaboration, process skills, and communication skills. Some of the rubrics are task specific and some are general; some are based on quantity (the number of possible solutions listed, for example) and some are more quality based.

(TC# 000.3CONCOC)

Crowley, Mary L. ***Student Mathematics Portfolio: More Than a Display Case.*** **Located in: The Mathematics Teacher 86, October 1993, pp. 544-547.**

The author discusses the use of mathematics portfolios to document progress on the "big" NCTM outcomes--problem solving, valuing mathematics, developing mathematical confidence, communicating mathematically, and reasoning mathematically. She includes a fair amount of detail on a middle school example--sample letter to students outlining the task, a description of what students need to include and a hint of how content might be assessed. The portfolio is semi-structured--the teacher specifies categories of entries and the student selects which samples of work to include in each category. Students must also write explanations for their selections.

A few samples of student work are included. Detailed performance criteria are not included.

(TC# 500.3STUMAP)

Csongor, Julianna E. ***Mirror, Mirror On The Wall...Teaching Self-Assessment to Students.*** **Located in: The Mathematics Teacher 85, November 1992, pp. 636-637. Also available from: Saint Maria Gosetti High School, 10th and Moore, Philadelphia, PA 19148.**

The author presents a procedure for getting high school students to self-reflect in math: during the final five minutes of a test, students estimate how sure they are about each answer they gave on the test (100%, 75%, 50%, or 0%). They can earn extra credit on the test if their estimates fall within 3% of their actual score. She reports that students are surprisingly accurate in their estimates and that the procedure works especially well with slow learners.

(TC# 500.3MIRMIW)

CTB McGraw-Hill. ***CAT/5 Performance Assessment Supplement, 1990.*** **Available from: CTB/McGraw-Hill, PO Box 150, Monterey, CA 93942, (800) 538-9547, fax (800) 282-0266.**

The "CTB Performance Assessments" are designed to either be stand-alone or integrated with the CAT/5 or CTBS/4. There are five levels for grades 2-11. The total battery includes reading/language arts, mathematics, science, and social studies and takes 2-3 hours to administer. There are 12-25 short- to medium-response questions for each subtest. The math and science subtests take 30-40 minutes. (For the CAT/5 there is a checklist of skills that can be used at grades K and 1.)

Some questions are grouped around a common theme. Many resemble multiple-choice questions with the choices taken off. For example, questions on one level include: "What are two ways that recycling paper products helps the environment?" "This table shows the air temperatures recorded every two hours from noon to midnight...At what time did the temperature shown on the thermometer most likely occur?" and "These pictures show some of the instruments that are used in science...List two physical properties of the water in the jar below that can be measured with the instruments shown in the pictures. Next to each property, write the name of the instrument or instruments used to measure the property."

Some of the answers are scored right/wrong and some are scored holistically. The materials we received contained no examples of the holistic scoring so we are unable to describe it. Scoring can be done either locally or by the publisher. When the *Performance Assessments* are given with the CAT/5 or CTBS/4, results can be integrated to provide normative information and scores in six areas. There are only three, however that use the math and science subtests: demonstrating content and concept knowledge, demonstrating knowledge of processes/skills/procedures, and using applications/problem-solving strategies. When the *Performance Assessments* are given by themselves, only skill scores are available.

The materials we received contain sample administration and test booklets only. No technical information or scoring guides are included.

(TC# 060.3CAT5PA)

CTB McGraw-Hill. *CTB Math Task Bank*, undated. Available from: CTB/McGraw-Hill, PO Box 150, Monterey, CA 93942, (800) 538-9547, fax (800) 282-0266.

The "CTB Math Task Bank" contains 644 math tasks for grades 3-9. (There is also a language arts bank.) Each series of questions is comprised of one or more theme-based activities. For example, the ninth grade bank contains a series of questions that relate to "selling advertisements for the yearbook." Questions require students to do such things as: identify how many ads of various sizes can fit on a single page; how much money different types of layouts can generate; and how many ads need to be sold to cover expenses. Most tasks are, thus, very structured and have only one right answer. However, a few are more open-ended. For example, a grade 4 task is: "You and a friend are playing a guessing game. You think of the number 10. Your friend must guess the number you have chosen. Give your friend some hints to help him guess this number. On the lines below, write four different hints about this number using math ideas." Additionally, some tasks attempt to get at self-reflection: "Draw a circle around the number below that shows how easy or how hard it was for you to solve the problems in this task."

The materials we received do not elaborate on scoring. It appears that most questions are scored right/wrong. Presumably then, the total number of points on questions covering each skill provide an indication of student ability. No direct judgments of problem solving, reasoning, communication, etc. are made.

Tasks can be accessed by student learning goal (tasks are cross-referenced to the NCTM standards), theme (e.g., year book ads), or question difficulty. CTB also publishes software to support the task bank. This includes test generation and scoring.

The materials we received did not contain technical information.

(TC# 500.3CTBMAT)

Curriculum Corporation. *Mathematics--A Curriculum Profile for Australian Schools*, *Mathematics--Work Samples*, and *Using the Mathematics Profile*, 1994. Available from: Curriculum Corporation, St. Nicholas Pl., 141 Rathdowne St., Carlton, Victoria, 3053, Australia, (03) 639-0699, fax (03) 639-1616.

These documents represent the mathematics portion of a series of publications designed to reconfigure instruction and assessment in Australian schools. The project, begun in 1989, was a joint effort by the States, Territories, and the Commonwealth of Australia, initiated by the Australian Education Council.

The profiles are not performance assessments, per se, in which students are given predeveloped tasks. Rather, the emphasis has been on conceptualizing major student outcomes in each area and articulating student development toward these goals using a series of developmental continuums. These continuums are then used to track progress and are overlaid on whatever tasks and work individual teachers give to students.

The math profiles cover the major strands of: working mathematically, space, number, measurement, chance/data, and algebra. Each strand has sub-areas called "organizers." For example, the strand of "working mathematically" contains the organizers of: investigating, conjecturing, using problem-solving strategies, applying and verifying, using mathematical language, and working in context. Each organizer is tracked through eight levels of development. For example, the organizer of "using mathematical language" has "talks about mathematical ideas in natural language" at Level 1, and "makes fluent use of mathematical notation in solving problems and presenting arguments succinctly, coherently and in conventional forms" at Level 8.

There are lots of support materials that describe what each strand means, how to organize instruction, types of activities to use with students, and how to use the profiles to track progress. Samples of student work are included to illustrate development. The documents say that the levels have been "validated," but this information is not included in the materials we received.

(TC# 500.3MATCUP)

Darling-Hammond, Linda, Lynne Einbender, Frederick Frelow, et al. ***Authentic Assessment in Practice: A Collection of Portfolios, Performance Tasks, Exhibitions, and Documentation,*** **October 1993. Available from: National Center for Restructuring Education, Schools, and Teaching (NCREST), Box 110 Teachers College, Columbia University, New York, NY 10027.**

This book contains sample performance assessments for grades 1-12 in science, math, social studies, writing and drama from a number of sources. Formats include exhibitions, projects, on-demand performance assessments and portfolios. The authors have included reprints of papers that discuss characteristics of "authentic" assessment, performance task design, and portfolios. Not all assessment information is reproduced; usually the editors have excerpted or summarized information. Performance tasks are more thoroughly covered than performance criteria. In most cases no technical information or sample student responses are provided.

There are four math examples for grades 1-10. Tasks include graphing, block patterns, building a dog pen, and doing the calculations necessary for a science experiment.

(TC# 000.3AUTASP)

Educational Testing Service. ***1992 AP Mathematics: Free-Response Scoring Guide and Sample Student Answers--Calculus AB - Calculus BC.*** **Available from: Advanced Placement Program, Mail Stop 85-D, Educational Testing Service, Rosedale Rd., Princeton, NJ 08541.**

The *Advanced Placement Program* (AP) enables participating colleges to grant credit or appropriate placement to students who demonstrate qualifying performance on the

examinations. AP exams are given in art, biology, chemistry, computer science, economics, English, French, German, government/politics, history, Latin, mathematics, music, physics, psychology, and Spanish. About 50 percent of each exam is free-response (essays, problems, etc.). (Studio art is a portfolio assessment.)

The sample free-response question we have is from the calculus examination. It requires students to show all their work. Three points are available for each part of the answer (nine points total). Points are awarded for the correct answer, and also for specific intermediate steps or products. Thus, scoring is task-specific and seems to result in a measure of conceptual understanding.

The document includes the problem, the ideal solution, and scored sample student responses. No technical information is included. Examples are apparently available for a variety of advanced placement exams, however only a single calculus question is included in the document we have.

(TC# 550.3ADVPLE)

Educational Testing Service. ***NAEP 1992 Mathematics Report Card for the Nation and the States,*** **April 1993, Report No. 23-ST02. Available from: Education Information Branch, Office of Educational Research and Improvement, US Department of Education, 555 New Jersey Ave NW, Washington, DC 20208, (800) 424-1616 or (202) 219-1651.**

The National Assessment of Educational Progress (NAEP) is congressionally mandated. Tests are given in reading, writing, math, science, social studies, fine arts, writing, literature, career development, and computers to students in grades 4, 8, and 12 on a revolving basis--not all subject areas are given each year. this entry describes the 1992 math assessment which tested approximately 220,000 students from 9,000 schools.

The on-demand tests covered numbers/operations, measurement, geometry, data analysis/statistics/probability, algebra/functions, and estimation. These content areas were covered at three levels: conceptual understanding, procedural knowledge, and problem solving. Some questions were multi-step. Calculators were allowed. There were both multiple-choice and short answer (e.g., measure an angle and write in the measurement) questions. Some of the questions required short explanations. For example, one fourth grade question asked students to choose the graph that represented the number of pockets in the clothing worn by a class of 20 students and provide an explanation of why they picked the graph they did. Responses were scored right/wrong.

The 1992 math assessment marks a shift to reporting by proficiency levels. For example, the "Basic" level designates conceptual and procedural understanding, while the "Advanced" level represents the ability to generalize and synthesize concepts and principles. (Note: The setting of cut-off scores on the tests relative to these levels has been controversial from a technical standpoint and will undergo further refinement.)

The report contains NAEP background information on the achievement levels and how they were set, sample items illustrating the levels, and lots of tables of results by states, regions, and various demographics such as gender and ethnicity. Released sets of items are available in other documents.

EQUALS. *Assessment Alternatives in Mathematics*, 1989. Available from: University of California, Lawrence Hall of Science, Berkeley, CA 94720, (415) 642-1823.

This document provides an overview of some possible assessment methods in mathematics that cover both process and products. Specific examples are provided for writing in mathematics, mathematical investigations, open-ended questions, performance assessment, observations, interviews, and student self-assessment. Any of the student-generated material could be self-selected for a portfolio of work. The document also includes a discussion of assessment issues and a list of probing questions teachers can use during instruction.

(TC# 500.6ASSALI)

Ferguson, Shelly. *Zeroing in on Math Abilities*, 1992. Located in: Learning92, Vol. 21, pp. 38-41.

The paper was written by a fourth grade teacher and describes her use of portfolios in math--what she has students put in their portfolios, the role of self-reflection, getting parents involved, and grading. She gives a lot of practical help. One interesting idea in the paper has to do with grading. At the end of the grading period she reviews the portfolios for attainment of concepts taught (not amount of work done), and progress toward six goals set by the NCTM standards (e.g., thinks mathematically, communicates mathematically, and uses tools). She marks which goals were illustrated by the various pieces of work in the portfolio and writes a narrative to the student.

Another interesting idea is formal presentations of their portfolios by students to their parents. The article provides a sample comment form for parents and students to complete.

(TC# 500.3ZERMAA)

Finston, D., A. Knoebel, and D. Kurtz. *Student Assessment Using Student Research Projects*, 1993. Available from: Douglas S. Kurtz, Professor of Mathematics, Department of Mathematical Sciences, New Mexico State University, Box 30001, Las Cruces, NM 88003, (505) 646-6218.

This three-year-old prototype program (used in grades 9-university) is based on "student research projects," multi-step assignments lasting up to several weeks, which attempt to evoke diverse problem-solving skills and well-written solutions in grammatically correct prose. In

the course of completing a project, students read, write and speak mathematics. Students work in groups of 3-4. Tasks require open-ended, extended responses. Samples in the document include remodeling a house, deciphering averages, determining tunnel clearances, and designing revolutionary solids.

Assessment of student work is based on teacher evaluations of written reports. Work may be graded holistically or based on predetermined guidelines. The sample scoring guides included in the document generally include content, process, and communication skills, but are fairly sketchy.

No technical information is included.

The author is in the process of preparing a book compiling information on the student research projects, but grants permission to educators for reproduction.

(TC# 500.3STUASU)

Fitzpatrick, Anne R., Kadriye Ercikan, and Steven Ferrara. *An Analysis of the Technical Characteristics of Scoring Rules for Constructed-Response Items*, 1992. Available from: CTB Macmillan/McGraw-Hill, PO Box 150, Monterey, CA 93942-0150, (800) 538-9547.

This was a paper presented at the annual meeting of the National Council on Measurement in Education, San Francisco, April 1992.

This paper reports on a technical study of the open-response portion of the 1991 administration of the Maryland state tests in reading and math. Items had a variety of scoring formats including different number of possible points and scoring tied to individual tasks. Results showed that the math open-response questions were hard, discriminated well between students having different achievement levels, and worked better when more score points were used. Thus, there is evidence that this set of open-response questions might offer more measurement accuracy than multiple-choice questions.

(TC# 060.6ANATEC)

Fitzpatrick, Robert and Edward J. Morrison. *Performance and Product Evaluation.* Located in: Educational Performance Assessment, Fredrick L. Finch (Ed.), 1991. Available from: The Riverside Publishing Company, 8420 Bryn Mawr Ave., Chicago, IL 60631, (800) 323-9540.

This paper has interesting discussions of the following topics:

1. What "authenticity" in tasks means. The authors' position is that there are many degrees and kinds of artificialities in tests. "Performance and product evaluation are those in which some criterion situation is simulated to a much greater degree than is represented by the usual paper-and-pencil test.... [However,] there is no absolute distinction

between performance tests and other classes of tests--the performance test is one that is *relatively* realistic."

2. Criteria for deciding how much "reality" to include in tasks.

3. Descriptions of various types of tasks that can be used in performance assessments: in-basket, games, role-plays, projects, etc.

4. Steps for developing performance assessments: analysis of the important dimensions of the skills to be covered, identification of tasks that cover as many of the important skills as possible, developing instructions and materials, and developing the scoring procedure.

Most specific examples are taken from military and business applications.

(TC# 150.6PERPRE)

Fraser, Barry J., John A. Malone, and Jillian M. Neale. ***Assessing and Improving the Psychosocial Environment of Mathematics Classrooms.*** **Located in: Journal for Research in Mathematics Education 20, 1989, pp. 191-201.**

This article describes the development of a short form of the *My Class Inventory* to be used in sixth grade math classes to measure the psychosocial characteristics of the classroom learning environment, i.e., social interactions.

(TC# 500.3ASSIMP)

Glaser, Robert. ***Expert Knowledge and Processes of Thinking.*** **Located in: Enhancing Thinking Skills in the Sciences and Mathematics, Diane Halpern (Ed.), 1992. Available from: Lawrence Erlbaum Associates, Publisher, 365 Broadway, Hillsdale, NJ 07642, (800) 926-6579.**

In this article the author describes research on expert performance. Although not directly about assessment, expert performance can be used to help understand and define the targets we have for students, which is the first step toward designing assessment. For example, expert performance can be used to develop criteria for evaluating performance tasks.

The author points out that, although expertise is very subject-specific, generalizations can be made about its nature across subjects: experts perceive large, meaningful patterns, have skillful self-regulatory processes, etc.

A critical point made by the author is that, "Practice, as it comes about in the usual course of training, is not necessarily very efficient. On the basis of our knowledge of the specific aspects of competence and expertise, we are able to find ways to compress or shortcut experience...." "This is one goal for performance assessment, we help students understand

current conceptions of the relevant dimensions of a task so that they don't have to rediscover this themselves."

(TC# 050.6EXPKNP)

Greenwood, Jonathan Jay. *On the Nature of Teaching and Assessing "Mathematical Power" and "Mathematical Thinking."* Located in: Arithmetic Teacher, November 1993, pp. 144-152.

The authors discuss the following topics: (1) the meaning of the NCTM goals of "mathematical power" and "mathematical thinking," (2) seven characteristics of sound mathematical thinking and ideas for instruction, and (3) general rating scales for rating each characteristic.

The seven characteristics are: (1) Everything you do in mathematics should make sense to you. (2) Whenever you get stuck, you should be able to use what you know to get yourself unstuck. (3) You should be able to identify errors in answers, in the use of materials, and in thinking. (4) Whenever you do a computation, you should use a minimum of counting. (5) You should be able to perform calculations with a minimum of rote pencil-paper computations. (6) When the strategy you are using isn't working, you should be willing to try another strategy instead of giving up. (7) You should be able to extend, or change, a problem situation by posing additional conditions or questions.

This is a useful paper for assisting teachers in knowing the characteristics of sound mathematical thinking.

No technical information is included. Sample instructional tasks and student performances are included.

(TC# 500.6ONNATT)

Hall, Greg. *Alberta Grade 9 Performance-Based Assessment--Math*, 1992. Available from: Greg Hall, Student Evaluation Branch, Alberta Education, Box 43, 11160 Jasper Ave., Edmonton, AB T5K 0L2, Canada.

The 1992 ninth grade math performance assessment entailed six stations with hands-on activities. Students circulate through the stations; testing time for each group of six students is 90 minutes. Some of the six tasks were open-response and some were open-ended; all were assessed for problem solving. The six tasks involved applications of rearranging squares to form different perimeters for the same area, measurement and mapping, surface area, collecting and graphing information, estimation, and combinations/permutations. (The Grade 9 pilot field-tested 14 other tasks. The Grade 6 pilot field-tested 11 tasks.)

Responses to the Grade 9 tasks were scored using an analytical trait system having two dimensions: problem solving and communication. Each trait was scored on a scale of 0

(totally misunderstood or blank) to 3 (readily understood the task, developed a good strategy, carried out the strategy and generalized the conclusion). A few *possible* student responses are included to illustrate scoring, but no *actual* student responses are included. No technical information is included.

(TC# 500.3ALBGRN)

Halpern, Diane (Ed.). *Enhancing Thinking Skills in the Sciences and in Mathematics*, 1992. Available from: Lawrence Erlbaum Associates, Publishers, 365 Broadway, Hillsdale, NJ 07642, (800) 926-6579.

This book is not strictly about assessment. Rather, it discusses the related topics of "What should we teach students to do?" and "How do we do it?" The seven authors "criticize the conventional approach to teaching science and math, which emphasizes the transmission of factual information and rote procedures applied to inappropriate problems, allows little opportunity for students to engage in scientific or mathematical thinking, and produces inert knowledge and thinking skills limited to a narrow range of academic problems." (p. 118). In general, they recommend that teachers focus on the knowledge structures that students should know, use real tasks, and set up instruction that requires active intellectual engagement.

The authors give various suggestions on how to bring this about: instructional methods, videodiscs, group work, and a host more. The final chapter analyzes the various positions and raises theoretical issues.

(TC# 500.6ENHTHS)

Hartman, Charlotte. *Mathematical Power Opens Doors*, 1993. Available from: Vancouver School District, PO Box 8937, Vancouver, WA 98668, (206) 696-7011.

Vancouver School District is developing open-ended mathematics problems to supplement its multiple-choice tests of content. Pilots are being undertaken in several grade levels; however, we only have examples for grade 6.

The document we have contains: (1) a restatement of the "big" NCTM outcomes (problem solving, reasoning, communication, connections); (2) three sample problems (all written and completed individually); (3) a scoring guide (generalized scoring guide rating the five traits of problem solving, communication, reasoning, math concepts and math procedures). The district is gathering benchmarks to illustrate each of the five traits.

A personal communication indicated that materials are used in two phases. First, several problems are done in a group to model how to proceed. Then, students choose three of five problems to do individually.

No technical information is available.

(TC# 500.3MATPOO)

Harvey, John G. ***Mathematics Testing With Calculators: Ransoming the Hostages.*** **Located in: Mathematics Assessment and Evaluation: Imperatives for Mathematics Educators, Thomas A. Romberg (Ed.), 1992. Available from: State University of New York Press, State University Plaza, Albany, NY 12246.**

This paper looks at the use of calculators in mathematics testing. The premise is that if we want students to investigate, explore and discover, assessment must not just measure mimicry math. Tests designed to really require calculators are more likely to be able to do this. Additionally, it is important to incorporate calculators into the curriculum because in the technological world of the future, calculators will be essential. If we want teachers to use calculators in instruction, we need to incorporate them into testing.

The author analyzes three types of test with respect to calculator use, describes things to consider when designing calculator tests, and describes current activity in developing "calculator-active" tests.

(TC# 500.6MATTEC)

Hibbard, K. Michael. ***Region 15 - Together for Students - A Community of Learners,*** **1993. Available from: Region 15 School District, PO Box 395, Middlebury, CT 06762, (203) 758-8250.**

Pomperaug Regional School District 15 staff have worked for seven years to define the most important products (such as graphs) and performances (such as oral presentations) which students should be able to make and do. "Lists" (rubrics), developed for each skill at the elementary, middle and high school levels, describe the salient features of performance and are used for grading and student self-assessment.

This document contains handouts used in a training session that appear to be an overview of the district student assessment system. In addition to a general overview and philosophy statement, the handouts include sample assessment materials in science, social studies, math, and writing for grades 1-12.

The math information includes checklists for assessing graphs and two sample graphing activities.

No technical information nor samples of student work are included.

(TC# 000.6TOGSTC)

Hibbard, K. Michael. ***Self-Assessment Using Performance Task Assessment Lists*****, 1994. Available from: Region 15 School District, PO Box 395, Middlebury, CT 06762, (203) 758-8250.**

Pomperaug Regional School District 15 (Middlebury, CT) has developed performance criteria for a wide variety of student products and performances. These criteria, called "task assessment lists" are written to be developmentally appropriate for various grade levels (primary, elementary, and secondary). The lists are used to communicate to students the attributes of quality products and performances, promote student self-assessment and self-reflection, and grading. This document contains sample task assessment lists for graphs.

(TC# 500.3SELUSP)

Horn, Kermit, and Marilyn Olson. ***1992-1993 Lane County Fourth Annual Project Fair. Official Guidelines, Criteria & Registration Forms for Grades K-12.*** **Available from: Kermit Horn or Marilyn Olson, Project Fair Coordinators, Lane Education Service District, Instructional Services Division, PO Box 2680, Eugene, OR 97402, (503) 689-6500.**

This document is the handbook given to students in grades K-12 interested in registering for the Lane County project fair. It contains information on registration, criteria by which projects will be judged, as well as help with getting started.

The document also gives some excellent ideas on interdisciplinary projects.

Some journal entries from past submissions are included to show students what to do. No samples that illustrate score points on criteria are included; the criteria, although an excellent start, are still a little sketchy.

(TC# 000.3LANCOP)

Hynes, Michael C. ***K-5 Mathematics Program Evaluation - A Florida Model Curriculum Project; School Handbook,*** **1993. Available from: University of Central Florida, College of Education, Orlando, FL 32816, (407) 823-6076.**

In cooperation with a team of educators throughout the state of Florida, the author has produced a handbook intended to provide schools with the tools to assess the K-5 mathematics program dimensions of: student outcomes, program goals, curriculum, learning environment, learning resources, program support, evaluation, and equal access. The handbook includes sample instruments for each area. Most of these are surveys except for assessment of student outcomes.

Seventeen sample performance tasks (eight for primary and nine for grade 5) are included to assess various student outcome goals. These are open-ended (there is more than one correct answer) and most require explanations of, and rationale for, procedures used. Tasks do not

require manipulatives; all are written/visual. All tasks are done individually; there is no group collaboration. Performance is rated using a generic four-point scale--"Exemplary (Level A)" to "No Attempt (Level E)." An Exemplary response is one which: "Provides excellent responses in all areas of problem solving, reasoning, communication, connections, and mathematics content. Goes beyond the excellent category. Shows creative thinking, elegant communication, and/or unique approaches to the problem. Uses additional information to extend the solution." A sample student response for each score point is included to illustrate the scoring procedure.

A sample "School Report Card" is included to illustrate "a succinct way to report the results" of all surveys and assessments.

The handbook includes a disk containing each of the instruments, the "School Report Card" and the scoring rubric. No technical information is included. The author has granted permission for educators to reproduce materials for use with students.

(TC# 500.3K-5MAP)

Illinois State Board of Education. ***Defining and Setting Standards for the Illinois Goal Assessment Program, (IGAP)*****, 1991. Available from: Illinois State Board of Education, 100 N. 1st St., Springfield, IL 62777.**

This paper describes Illinois' procedure for setting standards on the IGAP in grades 3, 6, 8, and 11. The steps include:

1. Creating descriptions of what students look like at three levels of competence: does not meet the state goal for learning, meets the state goal for learning, and exceeds the state goal for learning

2. Judgments by educators of the percent of students at each level that are likely to get each item correct

3. Adjustment of judgments by looking at the actual percentage of students getting the items correct

The paper includes a description of the process and descriptions of students at grades 3, 6, 8, and 11 at each level of competence in math.

(TC# 000.6DEFSES)

Johnson, Judi Mathis. ***Portfolio Assessment in Mathematics: Lessons from the Field.*** **Located in: <u>The Computing Teacher</u> 21, March 1994, pp. 22-23.**

The author describes the results of a study in which she interviewed 20 successful math teachers. Her major conclusion is that math, assessment, and technology should not be

competitors for teachers' attention, but components of a successful math classroom. Portfolios are used to document student learning and promote learning and student responsibility for learning through self-reflection. Technology is used to learn concepts, produce work for the portfolios, and to produce the portfolio itself. Assessment is used to guide planning and influence instruction.

(TC# 500.6PORMAL)

Kansas State Board of Education. *Kansas Mathematics Standards and 1991 Kansas Statewide Pilot Assessment Results*, 1991. Available from: Kansas State Board of Education, Kansas State Education Building, 120 SE 10th Ave., Topeka, KS 66612.

This is an overview of the 1991 Kansas pilot math assessment and a description of results. Students from grades 3, 7, and 10 were tested. The pilot included both multiple-choice and open-performance problems. The performance assessment portion entailed giving 1/6 of the students tested one task each. A total of 31 tasks were used altogether in the three grades. Nine problems are included in the report.

Responses were scored using both a holistic scale (0-6) for overall correctness of response, and a four-trait analytic model focusing on problem-solving processes (understanding the question, planning, implementing the strategies selected, and verifying the results). Each trait is rated on a six-point scale (A-F). Scoring guides are included, but detailed instructions and sample student work are not.

Some information on student performance is included, but no other technical information on the test itself is included.

(TC# 500.3KASMAS)

Katims, Nancy, Pat Nash, and Cynthia M. Tocci. *Linking Instruction and Assessment in a Middle School Mathematics Classroom.* Located in: Middle School Journal 25, November 1993, pp. 28-35.

Educational Testing Service (ETS) is developing the PACKETS Program, consisting of math exercises designed to promote the "big ideas" in math through activities relevant to students. PACKETS activities, for grades 6-8, pose real-life problems for which the solution must address the needs of a specified client. Some group and some individual work is required.

The article includes a few sample exercises, sample lesson plans, teacher and student responses to the tasks, and sample student work. It appears that scoring is left up to teachers. Work is assessed on the dimensions of problem-solving strategy, communication, math concepts and completeness of the answer. Criteria for assessing work and student understanding of the criteria are only sketchily discussed.

(TC# 500.3LININA)

Kloosterman, Peter, and Frances K. Stage. ***Measuring Beliefs About Mathematical Problem Solving.*** **Located in: School Science and Mathematics 92, March 1992, pp. 109-115.**

The authors describe the development of a scale to assess student beliefs about mathematics. The instrument, designed for grades 7+, is called the *Indiana Mathematics Beliefs Scale.* Thirty-six questions cover six beliefs: (1) I can solve time-consuming mathematics problems. (2) There are word problems that cannot be solved with simple, step-by-step procedures. (3) Understanding concepts is important in mathematics. (4) Word problems are important in mathematics. (5) Effort can increase mathematical ability. (6) Mathematics is useful in daily life.

The paper includes technical information based on studies with college students.

(TC# 500.3MEABEM)

Knight, Pam. ***How I Use Portfolios in Mathematics*****, 1992. Located in: Educational Leadership 49, pp. 71-72. Also available from: Twin Peaks Middle School, Poway Unified School District, 14012 Valley Springs Road, Poway, CA 92064.**

The author describes her first year experimentation with portfolios in her middle school algebra classes. She had her students keep all their work for a period of time and then sort through it to pick entries that would best show their effort and learning in algebra and the activities that had been the most meaningful. There is some help with what she did to get started and discussion of the positive effects on students. There is some mention of performance criteria, but no elaboration. One student self-reflection is included, but no technical information.

(TC# 530.3HOWIUS)

Koretz, Daniel, Daniel McCaffrey, Stephen Klein, et al. ***The Reliability of Scores from the 1992 Vermont Portfolio Assessment Program--Interim Report,*** **December 1992. Available from: RAND Institute on Education and Training, National Center for Research on Evaluation, Standards, and Student Testing, UCLA Graduate School of Education, 10880 Wilshire Blvd., Los Angeles, CA 90024, (310) 206-1532.**

Beginning in 1990, RAND has been carrying out a multi-faceted evaluation of Vermont's portfolio assessment program. This paper reports on reliability findings of the study conducted during school year 1991-92. Basically, RAND found that interrater agreement on portfolio scores was very low for both writing and math. The authors speculate that this resulted from aspects of scoring systems, aspects of the operation of the program, and the nature and extent of training raters.

This report provides good advise and caution for others setting up portfolio systems for large-scale assessment.

(TC# 150.6RELSCV)

Koretz, Daniel, Brian Stecher, and Edward Deibert. ***The Vermont Portfolio Assessment Program: Interim Report on Implementation and Impact, 1991-92 School Year.*** **Available from: RAND Institute on Education and Training, National Center for Research on Evaluation, Standards, and Student Testing, UCLA Graduate School of Education, 10880 Wilshire Blvd., Los Angeles, CA 90024, (310) 206-1532.**

Beginning in 1990, RAND has been carrying out a multi-faceted evaluation of Vermont's portfolio assessment program. This paper reports on questionnaires and interviews conducted during school years 1990-91 and 1991-92. Results indicated that:

1. There was a significant impact on instruction, but teachers felt somewhat confused about what they were supposed to do.
2. The portfolios took a lot of classroom space and tended to be viewed by teachers as an add-on rather than as "the" instruction.
3. Teachers felt they knew more about students as the result of doing portfolios.
4. Students had some difficulty doing portfolio problems.
5. Reported effect on low achieving students was mixed.

(TC# 150.6VERPOP)

Kulm, Gerald. (Ed.) ***Assessing Higher Order Thinking in Mathematics*****, 1990. Available from: American Association for the Advancement of Science, 1333 H Street NW, Washington, DC 20005, (301) 645-5643.**

This book contains a series of articles that address various topics in mathematics assessment. The articles address three broad topics:

1. The rationale for assessing mathematics problem solving and the need to have assessment devices that reflect this emphasis.
2. Issues that come up when trying to assess higher-order thinking skills in mathematics.
3. General discussions of what to assess and how to assess it.

There are a few examples of actual assessment techniques. The most relevant articles are included on this bibliography as separate entries.

(TC# 500.6ASSHIO)

Lambdin, Diana V. and Vicki L. Walker. *Planning for Classroom Portfolio Assessment.* Located in: Arithmetic Teacher, February 1994, pp. 318-324.

The authors report on the development of a portfolio system for their secondary mathematics students. (This was part of a larger project for all grade 3-12 teachers.)

The authors have students assemble a "permanent portfolio" from a "working portfolio." The working portfolio is a place to store all potential permanent portfolio entries. The permanent portfolio is assembled from the working portfolio. All portfolios are stored in an easily accessible place in the classroom. The goals are to promote student self-assessment, improve communication with students and parents, and gain a broader picture of the student than available with traditional tests. The goal is not to assess student knowledge. The authors include task guidelines that are given to students.

In addition to student and peer evaluation of portfolio selections and the portfolio as a whole, the teacher has guidelines for grading. Grades are based on diversity of selection, written reflections about selections, and portfolio organization. The authors present a little detail that flesh out these criteria.

The document includes some student work but no technical information.

(TC# 500.3PLAPOA)

Lane, Suzanne. *QUASAR Cognitive Assessment Instrument, (QCAI)*, 1993. Available from: QUASAR (Quantitative Understanding: Amplifying Student Achievement and Reasoning), Learning Research & Development Center, University of Pittsburgh, 3939 O'Hara St., Pittsburgh, PA 15260, (412) 624-7791.

The QCAI (QUASAR Cognitive Assessment Instrument) is designed to measure long-term growth of students in the area of math thinking and reasoning skills. Information for this review was taken from the following publications: *Principles for Developing Performance Assessments: An Example of Their Implementation* (Lane & Carol Parke, AERA, 1992); *Empirical Evidence for the Reliability and Validity of Performance Assessments* (Lane, Clement Stone, Robert Ankenmann & Mai Liu, AERA, 1992); *The Conceptual Framework for Development of a Mathematics Performance Assessment Instrument* (Lane, AERA, 1991); *Validity Evidence for Cognitive Complexity of Performance Assessments: An Analysis of Selected QUASAR Tasks* (Maria Magone, Jinfa Cai, Edward Silver, and Nign Wang, AERA, 1992); and *Conceptual and Operational Aspects of Rating Student Responses to Performance Assessments* (Patricia Kenney and Huixing Tang, AERA, 1992).

Thirty-three tasks were designed for sixth and seventh graders. No single student receives more than nine tasks in any 45-minute sitting. The tasks were designed to provide a good sample of math thinking and reasoning skills by having a variety of representations, approaches and problem strategies. Specifically, students were asked to provide a justification for a selected answer or strategy, explain or show how an answer was found, translate a problem into another representation (picture or equation), pose a mathematical question, interpret provided data, and extend a pattern and describe underlying regularities. The tasks were carefully field-tested for bias and confusing or difficult instructions. General descriptions for all the tasks, and details on a few individual tasks, are provided in these materials.

Scoring is done via a generalized holistic, four-point rubric which directs raters to consider mathematical knowledge, strategic knowledge and communication. (Each of these dimensions is laid out very clearly and could be used as the basis of an analytical trait scoring scale.) The generalized rubric is then applied to each problem by specifying features of responses that would fall at different scale points. The generalized scoring guide is included in these materials, but not the task-specific adaptations.

(TC# 500.3QUACOA)

Larter, Sylvia. ***Benchmarks: The Development of a New Approach to Student Evaluation*****, 1991. Available from: Toronto Board of Education, 155 College St., Toronto, ON M5T 1P6, Canada, (416) 598-4931.**

Benchmarks are student performances on tasks tied to Provincial educational goals. Each Benchmark activity lists the goals to be addressed, the task, and the scoring system. To develop the Benchmarks, two observers were used for each student--one to interact with the student and one to record observations. Tasks vary considerably. Some require very discrete responses (e.g., knowledge of multiplication facts using whatever means the student needs to complete the task), while some are more open-ended. There are 129 Benchmarks developed in language and mathematics for grades 3, 6, and 8.

For many of the tasks, a general, holistic, seven-point scale ("no response" to "exceptional performance [rare]") was used as the basis to develop five-point, task-specific, holistic scoring scales. For other tasks, scoring appears to be right/wrong. Holistic scoring seems to emphasize problem solving, method of production, process skills, and accuracy, although students can also be rated on perseverance, confidence, willingness, and prior knowledge, depending on the Benchmark.

The percentage of students at each score point (e.g., 1-5) is given for comparison purposes, as are other statistics (such as norms) when appropriate. Anchor performances (e.g., what a "3" performance looks like) are available either on video or in hard copy.

This report describes the philosophy behind Benchmarks, how they were developed, and a few of the specific Benchmarks. Some technical information is described (factor analysis, rater agreement), but no student performances are provided.

(TC# 100.6BENCHM)

Lash, Andrea. *Arithmetic Word Problems: Activities to Engage Students in Problem Analysis*, 1985. Available from: Far West Laboratory, 730 Harrison St., San Francisco, CA 94107, (415) 565-3000.

This is a book of arithmetic word problems selected by the author to promote problem solving. Some are multiple-choice and some are open-response. The author categorizes problems as being "word problems," "process problems," "applied problems," and "puzzle problems." The author also presents a model for the steps in problem solving and a discussion of the implications for instruction. Problems are grouped according to the step in the problem-solving process they relate to.

Most of the problems have only one right answer and none seem to utilize manipulatives. However, problems are presented for addition, subtraction, multiplication, division, multi-step problems, and problems containing unnecessary information. Some might be useful as tasks in a performance assessment.

(TC# 500.2ARIWOP)

Lawrence, Barbara. *Utah Core Curriculum Performance Assessment Program: Mathematics*, 1993. Available from: Profiles Corporation, 507 Highland Ave., Iowa City, IA 52240.

The Utah State Office of Education has developed 90 constructed-response items in mathematics, science and social studies (five in each of grades 1-6 for each subject) to complement multiple-choice tests already in place. Assessments are designed to match the Utah Core Curriculum goals. Although districts are required to assess progress toward these goals, the state-developed assessments are optional.

The mathematics assessments are designed to measure six to ten of the following areas of student competence (depending on grade level): logical reasoning, number meanings, number operations, number representation, computation, estimation, algebra, data sets, probability, geometry, measurement, fractions, and patterns. Each task has several questions relating to the same theme. For example, a sixth grade task called "Lab Tech" has students do such things as: complete a number sequence (adding milliliters to a chemical solution every 10 minutes), and "You need to plant two kinds of seeds. You must have 12 pots of one kind of seeds and 18 pots of the other kind of seeds. You need to plant the same total number of each kind of seed. What is the least number of each kind of seed you could plant?"

Scoring is task-specific and based on the degree of correctness of the response. For example, in the "Lab Tech" example, the student gets 3 points if he or she correctly completes the entire sequence. Points are totaled for each task and between tasks for each of the skill areas being assessed. Four levels of proficiency on each skill are identified: advanced, proficient, basic and below basic. Cut scores for each level are based on percent correct (approximately 90%=advanced, 70%=proficient, 40%=basic, below 40%=below basic) and behavioral descriptions of performance at each level.

Assessment activities are bound in books for each grade level/subject. Each task includes teacher directions, student test-taking materials, and scoring guides. The Office of Education has collected information on teacher reaction to the assessments from the field test. No other technical information is available at this time. A training video is available which helps teachers use the assessments.

Leach, Eilene L. *An Alternative Form of Evaluation that Complies with NCTM's Standards.* Located in: The Mathematics Teacher 85, November 1992, pp. 628-632. Also available from Centaurus High School, 10300 S. Boulder Rd., Lafayette, CO 80026.

This teacher uses scored discussions to assess and promote problem solving, communicating mathematically, and group process skills in her high school math classes. She has three to six students face each other in front of the rest of the class and spend about five minutes trying to solve a problem. Individuals can earn positive points for such things as "determining a possible strategy to use," "recognizing misused properties or arithmetic errors," or "moving the discussion along." They can earn negative points by doing such things as: "not paying attention or distracting others," and "monopolizing."

The article has a thorough discussion of how the teacher sets up the classroom, introduces the procedure to students, scores the discussion, and handles logistics. The author also discusses the positive effects this procedure has had on students, and the additional insight she has obtained about her students.

All scoring is teacher-centered, but it wouldn't necessarily have to be. No technical information is included.

(TC# 500.3ALTFOE)

Lehman, Michael. *Assessing Assessment: Investigating a Mathematics Performance Assessment*, 1992. Available from: The National Center for Research on Teacher Learning, 116 Erickson Hall, Michigan State University, East Lansing, MI 48824-1034.

This monograph, by a high school math teacher, describes his attempt to develop a better method of assessing algebra problem solving, concepts, and skills than traditional paper-and-pencil tests. The assessment technique involves giving students problems to solve as a group,

and then having them explain their results in front of a panel of judges. Three examples of problems are provided, as is a brief description of the scoring criteria (making sense of the problem, and problem-solving strategies), accuracy of results, interpreting results, ability to communicate results, and an explanation of what they did. However, these criteria are not elaborated on, and, although samples of student explanations are provided, these are used to describe the understandings the teacher reached about his students, not to anchor the performance criteria.

The author also provides a brief summary of the strategies he uses to help students develop greater depth in their understanding of algebraic principals and their interrelationships--small group cooperative learning, requiring justifications of approaches, etc.

(TC# 530.3ASSASI)

Lehman, Michael. *Performance Assessment--Math*, 1992. Available from: Michael Lehman, Holt Senior High School, 1784 Aurelius Rd., Holt, MI 48842, (517) 694-2162.

This paper is related to the one above, and provides additional information. Students are given six problems (some having only one right answer and some having more than one right answer) to solve as a team (four students per team). The team then spends an hour with a panel of three judges. Judges can ask any student to explain the team's solution and problem-solving strategy on any of the six problems. (Therefore, all students must have knowledge of all six problems.) Then the judges assign the team a new problem to work on while they watch.

Student responses are scored on: making sense of the problem, solution strategies, accuracy of results, ability to communicate results, ability to answer questions posed by the judges, three judgments of group-process skills, and an overall judgment of student understanding.

A complete set of ten tasks (six pre-assigned, and four on-the-spot) are included for Algebra II. The scoring guide and a few sample pre-calculus projects are also included. No technical information nor sample student performances are included.

(TC# 500.3PERASM)

Lesh, Richard. *Computer-Based Assessment of Higher Order Understandings and Processes in Elementary Mathematics.* Located in: <u>Assessing Higher Order Thinking in Mathematics</u>, Gerald Kulm (Ed.), 1990. Available from: American Association for the Advancement of Science, 1333 H Street NW, Washington, DC 20005, (301) 645-5643.

This article is as much about how meaningful learning occurs and the nature of the structure of knowledge in mathematics, as it is about use of computers in math instruction and assessment. The basic premise is that computer-based tests should not simply be pencil-and-paper tests delivered on-line. They should be part of an integrated instruction and assessment

system that supports both learning facts and developing the meaningful internal structuring of these facts to form a coherent knowledge system.

The article discusses three things:

1. Principles underlying a modeling perspective of learning and assessment (ideas such as: learning and problem-solving situations are interpreted by the learner by mapping them to internal models, and several "correct" alternative models may be available to interpret a given situation)

2. Five objectives that should be emphasized in K-12 math (such as going beyond isolated bits of knowledge to construct well-organized systems of knowledge, and think about thinking)

3. Specific types of assessment items that can be used to measure these deeper and broader understandings (such as conceptual networks and interactive word problems)

Many sample problems are provided.

Lesh, Richard and Susan J. Lamon, Eds. *Assessment of Authentic Performance in School Mathematics*, 1992. Available from: American Association for the Advancement of Science, 1333 H St. NW, Washington, DC 20005.

This book contains articles by several authors on the topics of: assessment objectives--what should we assess; examples of assessments; classroom assessment; and scoring and reporting.

(TC# 500.6ASSAUP)

Lester, Frank K, Jr. *An Assessment Model for Mathematical Problem Solving*. Located in: Teaching Thinking and Problem Solving 10, September/October, 1988, pp. 4-7. Also available from: Lawrence Erlbaum Associates, Inc., Journal Subscription Department, 365 Broadway, Hillsdale, NJ 07642, (800) 962-6579

This article presents a model for assessing both the problem-solving performance of students and assessing the task demands of the problem to be solved. The dimensions of problem solving (which could be used as a scoring rubric) are: understanding/formulating the question in a problem, understanding the conditions and variables in the problem, selecting the data needed to solve the problem, formulating subgoals and selecting appropriate solution strategies to pursue, implementing the solution strategy and attaining subgoals, providing an answer in terms of the data in the problem, and evaluating the reasonableness of an answer. The article describes these in some detail.

The problem features that can affect a student's success in solving a problem are: the type of problem, the strategies needed to solve it, the mathematical content/types of numbers used, and the sources from which data need to be obtained to solve the problem.

(TC# 500.3ANASSM)

Lester, Frank K. Jr., and Diana Lambdin-Kroll. *Assessing Student Growth in Mathematical Problem Solving*. Located in: Assessing Higher Order Thinking in Mathematics, Gerald Kulm (Ed.), 1990. Available from: American Association for the Advancement of Science, 1333 H Street NW, Washington, DC 20005, (301) 645-5643.

The authors present a model of factors that influence problem-solving performance, and discuss several problem-solving assessment techniques.

A good assessment program in math should collect information about the following: affect (attitudes, preferences, and beliefs), and cognitive/processes ability to get the right answer (both whether they get the right answer, and the strategies used). The program should also systematically define and cover the features of tasks (problem type, math content, required strategies, etc.) since these affect performance and should be reflected in instruction.

In order to gather information on these three categories of factors, the authors briefly review: observations, interviews, student self-reports, and holistic and analytic scoring of performances. They recommend against multiple-choice questions.

This paper is a general theoretical discussion; no actual tasks, problems or scoring guidelines are provided.

(TC# 500.6ASSSTG)

Marshall, Sandra P. *Assessing Knowledge Structures in Mathematics: A Cognitive Science Perspective*. Located in: Cognitive Assessment of Language and Mathematics Outcomes, Sue Legg & James Algina (Eds.), 1990. Available from: Ablex Publishing Company, 355 Chestnut St., Norwood, NJ 07648.

This article discusses the implications of recent advances in cognitive science for mathematics assessment. The goal in using this research to develop assessment techniques is to determine the extent to which students have acquired specific cognitive skills rather than merely whether they can correctly solve particular problems.

Cognitive theory holds that people solve problems by using three knowledge structures--declarative (facts), procedural (algorithms and production rules), and schema (frames that relate facts and production rules). To solve a problem, a person must first find the right schema, must then correctly implement a set of production rules, and must have stored correctly the facts and knowledge required to carry out the necessary algorithms specified by the production rules. Errors can occur in any of these three areas.

Researchers are currently engaged in specifying these knowledge structures in such detail that they can develop computer simulations that can, first, solve problems, and second, reproduce student errors by leaving out or altering various parts of the necessary structures. In this way, errors in student responses can be tracked back to the erroneous structure used. The author specifically mentions work in the area of simple arithmetic operations, geometry, and word problems.

Additionally, the author discusses two other ways of assessing these things in students--reaction time (to assess how automatic a function is); and multiple-choice problems (e.g., "which of the following problems can be solved in the same way as the one stated above?" to get at schema knowledge). Some time is spent with multiple-choice problems to explore various types of problems and the technical issues that arise with them.

It should be pointed out that all these procedures are experimental; none have progressed to the point where there is a final product that can be ordered and installed.

(TC# 500.6ASSKNS)

Marshall, Sandra P. ***The Assessment of Schema Knowledge for Arithmetic Story Problems: A Cognitive Science Perspective*****, 1990. Located in: Assessing Higher Order Thinking in Mathematics, Gerald Kulm (Ed.). Available from: American Association for the Advancement of Science, 1333 H Street NW, Washington, DC 20005, (301) 645-5643.**

The *Story Problem Solver* (SPS) was created to support instruction based on a theory of memory architecture called schemata. Under such theories, human memory consists of networks of related pieces of information. Each network is a schema--a collection of well-connected facts, features, algorithms, skills, and/or strategies.

Adult students are explicitly taught five problem-solving schemas and how to recognize which schema is represented by a story problem. SPS is a computerized assessment method in which several different item types are used: students pick out the schema or general solution strategy that fits a given story problem, decide which information in the story problem fits into the various frames of the schema, identify the steps needed to solve a problem, and decide whether the necessary information is given in the problem.

Some of the schema shells and item types are given as examples. No technical information is included.

(TC# 500.3ASSOFS)

Maryland Department of Education. ***Maryland School Performance Assessment Program*****, 1992. Available from: Gail Lynn Goldberg, Maryland Department of Education, Maryland School Performance Assessment Program, 200 W. Baltimore St., Baltimore, MD 21201, (410) 333-2000.**

Maryland has released six performance tasks that illustrate the 1992 assessment. This review is based on three of them, one task at each of grades 3, 5 and 8. The tasks are integrated across subject areas and use some combination of information and skills in science, math, writing, reading, and social studies. The three tasks we have relate to the weather (Grade 3), snowy regions of the country (Grade 5) and collisions (Grade 8). Each task has both individual and group work and proceeds through a series of exercises that require reading, designing and conducting experiments, observing and recording information, and writing up results.

Student responses are scored using two basic approaches: generalized holistic or analytical trait scoring for the "big" outcomes such as communication skills, problem solving, science process skills, and reasoning; and specific holistic ratings of conceptual knowledge and applications. For example, the task on collisions is scored both for knowledge of the concepts of mass and rate/distance, and for general science process skills (collecting and organizing data, and observation) and communication skills. Thus, some scoring guides are generalized across tasks, and some list specific features from individual tasks to watch for.

The materials we have allude to anchor performances and training materials, but these are not included in our samples. Neither information about student performance, nor technical information about the tests is included.

(TC# 060.3MARSCP)

Maryland State Department of Education. ***Scoring MSPAP (Maryland School Performance Assessment Program): A Teacher's Guide*****, 1993. Available from: Gail Lynn Goldberg, Maryland Department of Education, Maryland School Performance Assessment Program, 200 W. Baltimore St., Baltimore, MD 21201, (410) 333-2000.**

This document presents information about the 1993 MSPAP in grades 3, 5, and 8: philosophy, general approach, sample tasks, and performance criteria. There are sample tasks, performance criteria and student responses for the following areas: expository, persuasive and expressive writing, reading comprehension, math, science, and social studies.

Scoring can be done three different ways depending on the task: generalized scoring rubrics that can be used across tasks (e.g., persuasive writing); generalized scoring rules that are not as detailed as rubrics (e.g., language usage); and scoring keys that are task-specific (e.g., many math tasks are scored for the degree of "correctness" of the response)

No technical information is included.

(TC# 000.3SCOMST)

Maryland State Department of Education. ***Teacher to Teacher Talk: Student Performance on MSPAP (Maryland School Performance Assessment Program)*****, 1992. Available from: Gail Lynn Goldberg, Maryland Department of Education, Maryland School Performance Assessment Program, 200 W. Baltimore St., Baltimore, MD 21201, (410) 333-2000.**

This publication presents teacher reactions to their experience of scoring performance assessment tasks on the 1992 Maryland School Performance Assessment Program (MSPAP). The MSPAP covered reading, writing, math, social studies and science in grades 3, 5, and 8. Comments are organized by grade and subject. Most comments have to do with two topics: what teachers learned about students as the result of participating in the scoring, and how the performance tasks should be revised.

(TC# 000.6TEATET)

Marzano, Robert J., Debra J. Pickering, Jo Sue Whisler, et al. ***Authentic Assessment*****, undated. Available from: Mid-Continent Regional Laboratory (McREL), 2550 S. Parker Rd., Suite 500, Aurora, CO 80014, (303) 337-0990.**

This document appears to be a series of handouts used in training. Although not specifically about math, the document does discuss some "big" outcomes related to math such as complex thinking, information processing, communication, etc.

Materials include definitions of assessment terms, a procedure for developing performance assessment tasks, and samples of tasks and scoring guides. The general approach is mix and match--tasks are meant to elicit several target behaviors on the part of students which are then scored with generic performance criteria. For example, a problem-solving task requires students to draw a picture of their neighborhoods without using any circles or squares. Performances are scored for knowledge (geometry), complex thinking (ability to identify obstacles in the way of achieving desired outcomes), and effective communication (ability to express ideas clearly).

Sample tasks are in the areas of science, math and social studies. There are general mix-and-match scoring guides for: Knowledgeable Person, Complex Thinker, Information Processor, Effector Communicator/Producer, Self-Directed Learner, and Collaborative Worker. Scoring guides are generally not very descriptive. For example, one of the three traits included in the scoring guide for Skilled Information Processor is "effectively interprets and synthesizes information." To get a "4" (the highest score possible) the student "consistently interprets information gathered for tasks in accurate and highly insightful ways and provides synthesis of that information that are highly creative and unique." This is basically just a restatement of the trait title.

The authors have begun to develop a useful approach to performance assessment (mix-and-match tasks and performance criteria), but the criteria need to be filled out a little more.

Massell, Diane. ***Setting Standards in Mathematics and Social Studies.*** **Located in: Education and Urban Society 26, February 1994, pp. 118-140.**

This article describes, analyzes, and contrasts two efforts to set curriculum standards--the National Council of Teachers of Mathematics (NCTM) efforts in math, and the state of California's efforts in history-social studies. It describes the history of development and provides ideas on what it takes to have a successful development effort.

(TC# 000.5SETSTM)

Mathematical Science Education Board, National Research Council. ***Measuring Up--Prototypes for Mathematics Assessment,*** **1993. Available from: National Academy Press, 2101 Constitution Ave, NW, Washington, DC 20418, (800) 624-6242.**

Measuring Up is designed to illustrate performance assessment tasks that could be used with fourth graders to support reform efforts in mathematics instruction. The book presents 13 prototype assessments which are meant to be examples of assessment possibilities, not examples of ready-to-use assessments that provide an adequate sample of the NCTM standards.

Each task description contains the following information: time allotment, student grouping, assumed background knowledge of students, task description, student materials, rationale/explanation, and "protorubric." The 13 assessments have the following features: (1) they take 1-3 class periods; (2) some require collaboration; (3) most require student explanations; (4) they present a series of questions related to a general activity; (5) most have a single correct or best response, although a few are more open-ended; and (6) some have Spanish translations.

Scoring is based on "protorubrics," beginning scoring guides that are not yet fully fleshed out. All are task-specific and use a three-point scale--high, medium, or low response. Abstracting across "protorubrics," the following types of things are included in the "high" category: correctness of response, evidence of conceptual understanding, flexibility of thinking, clarity of presenting results, and problem solving. (However, the "protorubrics" do not themselves identify their own content in this manner, nor do all include everything on this list.) The "protorubrics" are not, in themselves, sufficient to interpret results; the "rationale" section for each assessment is also necessary.

Tasks were pilot-tested to ensure that they work as intended. No other technical information is available. Many samples of student responses are included.

Medrich, Elliott A., and Jeanne E. Griffith. *International Mathematics and Science Assessments: What Have We Learned?*, 1992. Available from: National Technical Information Service, US Department of Commerce, 5285 Port Royal Rd., Springfield, VA 22161, (703) 487-4650.

This report provides a description of the international assessments of math and science (First International Mathematics and Science Studies, 1960's; Second International Mathematics and Science Studies, 1980's; and First International Assessment of Educational Progress, 1988), some of their findings, and issues surrounding the collection and analysis of these data. It also offers suggestions about ways in which new data collection procedures could improve the quality of the surveys and the utility of future reports.

Meltzer, L. J. *Surveys of Problem-Solving & Educational Skills*, 1987. Available from: Educator's Publishing Service, Inc., 75 Moulton St., Cambridge, MA 02138.

Although this is an individual test published primarily for diagnosing learning disabilities for students aged 9-14, it has some interesting ideas that could be more generally applied. There are two parts to the test--a more-or-less standard individualized aptitude test, and a series of achievement subtests. The math subtest involves a fairly standard test of computation. The interesting part comes in the scoring. Each problem is scored on choice of correct operations, ability to complete the word problem, efficiency of mental computation, self-monitoring, self-correction, attention to operational signs, and attention to detail (one point for evidence of each trait).

After the entire subtest is administered, the teacher is guided through analysis of the student's strategies in completing the task--efficiency of approaching tasks, flexibility in applying strategies, style of approaching tasks, attention to the task, and responsiveness during assessment. (Each area is assigned a maximum of three points for the presence or absence of three specific features of performance. For example, under "efficiency" the students get a point if he or she does not need frequent repeating of instructions, a second point if the student implements the directions rapidly, and a third point if the student perseveres to complete the task.) Examples of scoring are included.

A fair amount of technical information is included. This covers typical performance, factor analysis, inter-rater reliability, relationship to other measures of performance, and comparison of clinical groups.

(TC# 010.3SUROFP)

Miller, Edward, Ed. ***The Push for New Standards Provokes Hope and Fear--and Both Are Justified.*** **Located in: The Harvard Education Letter 9, September/October 1993, pp. 1-6.**

The author's position is that new standards, in and of themselves, will not reform or improve American education in math. We also need to pay equal attention to developing teachers' skills and to providing all students with equal opportunity to learn. Roadblocks to *real* reform include: (1) outmoded tests; (2) lack of teacher sophistication in math; (3) pressure to cover all the material in textbooks; (4) lack of time for planning and learning; and (5) lack of materials and resources. The article also includes other topics such as the need for standards that emphasize different skills and not just attaining higher levels of traditional skills, lessons from other countries, and vignettes demonstrating the various points made in the article.

(TC# 500.5PUSNES)

Models of Authentic Assessment Working Group. ***Superitem Tests in Mathematics,*** **undated. Available from: National Center for Research in Mathematical Sciences Education, 1025 W. Johnson St., Madison, WI 53706, (608) 263-3605**

The document we received is a set of 20 open-response tasks that are designed to measure the statistics, measurement and geometry knowledge of middle school students (grades 7-9). Each of the 20 tasks has a set of four questions, each of which has only a single correct answer. From a sample problem, it appears that all responses are scored right/wrong using task-specific scoring guides.

The materials we received did not contain a description of which specific goals were covered by each question, sample student responses, scoring guides, contextual information, nor technical information.

(TC# 500.3SUPTM)

Mullen, Kenneth B. ***Free-Response Mathematics Test,*** **1992. Available from: American College Testing Program, PO Box 168, Iowa City, IA 52240, (319) 337-1051.**

This was a paper presented at the annual meeting of the National Council on Measurement in Education, San Francisco, April 1992.

This paper reports on a study by ACT that compares multiple-choice, open-response, and gridded response item formats on reliability, difficulty and discrimination. In gridded response items, students fill in "bubbles" that correspond to the answer rather than choosing the answer from a given list. "Testlets" were designed to cover the same content and have the same test length for each format. Results indicated that all formats had about the same reliability; there was good rater agreement on the open-ended problems; and grid and open-ended problems discriminated better between students with different achievement levels. The correlation between performances on the various types of items ranged from 0.5 to 0.7.

A few sample problems are provided. All open-response questions used scoring criteria that emphasize degree of correctness of the response and were tied to the task (i.e., there was a different scoring guide for each problem).

Mumme, Judy. *Portfolio Assessment in Mathematics*, 1990. Available from: California Mathematics Project, University of California--Santa Barbara, 522 University Rd., Santa Barbara, CA 93106, (805) 961-3190.

This booklet describes what mathematical portfolios are, what might go into such portfolios, how items should be selected, the role of student self-reflection, and what might be looked for in a portfolio. Many student samples are provided. Criteria for evaluating portfolios include: evidence of mathematical thinking, quality of activities and investigation, and variety of approaches and investigations. No technical information is included.

(TC# 500.6PORASI)

National Science Foundation. *Educating Americans for the 21st Century: A Plan of Action for Improving Mathematics, Science and Technology Education*, 1983. Available from: National Science Board Commission on Precollege Education in Mathematics, Science and Technology, Forms & Publications Unit, 1800 G St. NW, Room 232, Washington, DC 20550, (202) 357-3619.

This is not strictly a document regarding assessment, but rather a statement of what students need to know and be able to do in science and math. As such, it also provides an outline for what assessments should measure.

(TC# 000.5EDUAMF)

Nicoll, Richard, Kathy Jacobson, Jim Rybolt. *Curriculum-Based Alternative Assessment of Mathematics (CBAAM) [Third Grade and Sixth Grade] A Report to Teachers*, April 1993. Available from: Mt. Diablo Unified School District, 1936 Carlotta Dr., Concord, CA 94519, (510) 682-8000, ext. 4135.

This review is based on reports of the 1993 third and sixth grade assessments. Students respond to three extended problems, some of which have right/wrong answers and some of which are more generative. For example, one third grade problem requires students to plan a city. Students are directed to list "buildings and places needed to have a working community," pick 8-10 from the list, place these on a map, and describe the rationale for the placement. Students do both group and individual work.

A generalized, holistic, six-point scoring guide is tailored to individual problems. In the generalized version, a "6" is: "complete response with a clear, coherent, unambiguous, and

elegant explanation; includes a clear and simplified diagram when appropriate; communicates effectively to the reader; shows understanding of the open-ended problem's mathematical ideas and processes; identifies all the important elements of the problem." The document includes three scored student responses for each problem.

The document also includes a rationale for alternative assessment, and the context for the Mt. Diablo assessment. No technical information is included. The author has given educators permission to copy this document for their own use.

(TC# 500.3MTDIAC2)

Nicholls, John G., Paul Cobb, Erna Yackel, et al. ***Students' Theories About Mathematics and Their Mathematical Knowledge: Multiple Dimensions of Assessment.*** **Located in: Assessing Higher Order Thinking in Mathematics, Gerald Kulm (Ed.), 1990. Available from: American Association for the Advancement of Science, 1333 H St. NW, Washington, DC 20005, (301) 645-5643.**

This paper reports on a series of studies on student attitudes toward mathematics and their relationship to mathematical knowledge and understanding. Dimensions of attitudes toward math were:

1. How motivated students are to do math
2. Student beliefs about what causes success in math
3. Student views of the benefits of learning math.

All items are included.

(TC# 500.3STUTHA)

Oregon Department of Education. ***Oregon Dimensions of Problem Solving,*** **1994. Available from: Office of Assessment and Technology, Oregon Department of Education, 255 Capitol St NE, Salem, OR 97310, (503) 378-8004.**

The Oregon Department of Education began giving open-ended math problems to a sample of students in grades 3, 5, 8, and 11 in 1992. The five short, written problems used in each grade in 1992 are included in this document, as are student instructions. Responses are scored on four dimensions, or traits: (1) conceptual understanding of the problem--the ability to interpret the problem and select appropriate information to apply a strategy for solution; (2) procedural knowledge--the ability to demonstrate appropriate use of math; (3) skills to solve the problem; and (4) communication--the ability to use math symbols well and the ability to explain the problem solution.

Each trait is scored on a scale of 1-5. The 1994 scoring guides are included in this document along with one sample student problem. No technical information nor anchor papers are included.

(TC# 500.3ORDIPS)

Pandey, Tej. *Power Items and the Alignment of Curriculum and Assessment.* Located in: Assessing Higher Order Thinking in Mathematics, Gerald Kulm (Ed.), 1990. Available from: American Association for the Advancement of Science, 1333 H St. NW, Washington, DC 20005, (301) 645-5643.

The author presents a philosophy and approach for thinking about the development of a test of mathematics problem solving, and provides some examples of multiple-choice and short-answer "power" questions developed by the California Assessment Program.

The author maintains that typical content-by-process matrices used to specify the content of tests tend to result in tests that measure minuscule pieces of information that are fragmented and non-integrated. The author prefers to have assessment tasks that are broader in focus and cut across several process/content areas, so that in order to get the right answer, students must use skills like organizing information, representing problems, and using strategies.

(TC# 500.6POWITA)

Pandey, Tej. *A Sampler of Mathematics Assessment*, 1991. Available from: California Department of Education, Bureau of Publications, Sales Unit, PO Box 944272, Sacramento, CA 94244, (916) 445-1260.

This sampler describes the types of assessment that the California Assessment Program (CAP) is proposing to support curricular reforms. Illustrated and discussed are open-ended problems, enhanced multiple-choice questions, investigations, and portfolios. These four types of activities are intended to measure mathematical understandings that students develop over a period of several years.

This monograph includes a definition of "mathematical power"--the ultimate goal of mathematics instruction, guidance in the characteristics of assessment tasks that will encourage and measure power, a few sample student responses to problems, and help with implementation of alternative assessment.

All performance-based techniques will use a six-point holistic scale. This scale is briefly described. The scale will be tailored for individual tasks.

(TC# 500.3SAMMAA)

Paulson, Leon. ***Portfolio Guidelines in Primary Math*****, 1992. Available from: Multnomah County Educational Service District, PO Box 301039, Portland, OR 97220, (503) 255-1842.**

This monograph provides some assistance with getting started with portfolios in the primary grades. The author believes that the most important purpose for mathematics portfolios is to prompt students to take control of their own learning. Therefore, the student should be in control of the portfolio. (The author, however, also points out that there might be other audiences and purposes for the portfolios that might have to be addressed.)

The author provides some ideas for tasks that students could do to generate material for the portfolio, provides some very practical suggestions for getting started, gives ideas for activities to encourage student self-reflection, and shows some draft holistic criteria for evaluating portfolios.

An example of the user-friendly way this monograph provides practical help is: "Remember, the portfolio is telling a story. Each item in a portfolio is there for a reason. It should not require a mind reader to figure out why it is there. A portfolio entry includes a piece of work plus information that makes its significance clear--the reason it was selected, the learning goals illustrated, student self-reflections, and (always!) the date."

Note: A new version is due out in the fall of 1994.

Paulson, Leon, and Pearl Paulson. ***An Afternoon to Remember: A Portfolio Open House for Emotionally Disabled Students*****, 1992. Available from: Multnomah County Educational Service District, PO Box 301039, Portland, OR 97220, (503) 255-1842.**

Reynolds School District adapted Crow Island's "portfolio night" for use with severely emotionally disabled students. This paper describes how the afternoon was set up, what happened, student debriefing sessions, and changes in format based on student comments.

(TC# 000.6AFTREP)

Pfeiffer, Sherron. ***NIM Game Project*****, 1992. Available from: Southeast EQUALS, 14 Thornapple Dr., Hendersonville, NC 28739, (704) 692-4078.**

The assessments described in this document are appropriate for upper elementary and middle school students. Two project tasks are included, one individual and one group. The projects require students to create a game that requires application of math skills. These extended projects are used after students have had many opportunities to work with different kinds of NIM games. The extended nature of the project emphasizes persistence and the importance of quality products. Projects become part of a portfolio that shows growth over time.

The projects are scored using criteria specific to these tasks. The criteria revolve around the quality of the game and its usefulness in teaching the math skills specified. The project instructions and scoring guide are included. No sample student work nor technical information is included. This exercise is part of a book of teaching strategies produced by and available from the author: *Successful Teaching Strategies.*

The author has given educators permission to copy this document for their own use.

(TC# 500.3NIMGAP)

Pritchard, Diane. *Student Portfolios--Are They Worth the Trouble?*, 1992. Available from: Sisters Middle School, PO Box 555, Sisters, OR 97759, (503) 549-8521.

This paper was written by a middle school math and English teacher. It provides practical help with how to set up a portfolio system in math by describing her purpose for having a portfolio, the types of activities included, and activities to get students to self-reflect (including an idea for tests).

(TC# 500.3STUPOT)

Psychological Corporation, The. *GOALS: A Performance-Based Measure of Achievement*, 1992. Available from: The Psychological Corporation, Order Service Center, PO Box 839954, San Antonio, TX 78283, (800) 228-0752.

GOALS is a series of open-response questions that can be used alone or in conjunction with the MAT-7 or SAT-8, or any achievement test. Three forms are available for 11 levels of the test covering grades 1-12 in the subject areas of science, math, social studies, language and reading. Each test (except language) has ten items. The manual states that the math questions assess student problem solving, communication, reasoning, connections to other subjects, estimation, numeration, geometry, patterns, statistics, probability and algebra. Tasks are multiple, short problems. The manual draws the distinction between the approach taken in *GOALS* (efficiency in large-scale assessment), and the related publication "Integrated Assessment System" which has fewer tasks pursued in more depth.

Responses are scored on a scale of 0-3, where 0 is "response is incorrect" and 3 is "accurate and complete with supporting information." The scoring guide is generalized and is used for all problems. Scoring can be done locally or by the publisher. There is good assistance with scoring philosophy and procedures. There are two sample student performances for each score point for each question.

The holistic scales are combined in various ways to provide indicators of overall conceptual understanding and various specific aspects of problem solving and using procedures. These are, however, not scored directly. Rather, it is analogous to multiple-choice tests in which the correct items are combined in various ways to give subtest scores.

Both norm-referenced (percentiles) and criterion-referenced (how students perform on specific concepts) score reports are available. A full line of report types (individual, summary, etc.) are available.

The materials we obtained did not furnish any technical information about the test itself.

(TC# 510.3GOALS)

Psychological Corporation, The. ***Integrated Assessment System: Mathematical Performance Assessment*****, 1991. Available from: The Psychological Corporation, Order Service Center, PO Box 839954, San Antonio, TX 78283, (800) 228-0752.**

This is a series of 14 tasks designed to be used with students in grades 2-8. Two task booklets were designed for each grade level, but can also be used in spring testing of the grade below or fall testing of the grade above. Each task booklet presents a problem situation that is expanded on and applied to a series of questions. For example, various task booklets focus on symmetry, breaking a tie in an election, planning an orchard to maximize yield, and bar codes. Questions involve such things as figuring out an answer and explaining how the solution was reached, and generating a principle and applying it to a new situation.

Solutions are scored either holistically (0-6) or analytically (four, 4-point scales). The performance criteria represent generalized features of problem solving and so can be used to score performance on any task. The holistic scale is used to provide an overall picture of performance; raters look for quality of work, evidence of understanding of concepts, logical reasoning, and correct computations. The analytical traits are: reasoning, conceptual knowledge, communication, and procedures. Scoring can be done either locally or by the publisher.

The set of materials we obtained includes a brief description of the scoring rubrics and one example of a scored student test. Technical information was not included.

(TC# 500.3INTASM)

Riverside Publishing Company, The. ***Arizona Student Assessment Plan--Mathematics.*** **Available from: The Riverside Publishing Co., 8420 Bryn Mawr Ave., Chicago, IL 60631, (800) 323-9540.**

Arizona is developing open-response, on-demand assessments in math, reading, writing, social studies, and science for grades 3, 8, and 12. The math test has been used for about two years; the science test is still under development. The mathematics test requires no manipulatives or equipment. Students provide short answers to a series of questions surrounding a common theme, such as a rock climbing competition or a "pizza spinner." They also sometimes provide explanations for responses or show computations.

Scoring is task-specific. Points are assigned for the correctness of the response or the number of responses given.

The tests were developed by Riverside and are under copyright restriction until at least 1996. Permission to use any part of the assessment must be granted both by Riverside and the Arizona Department of Education.

(TC# 500.3ARISTM) -- IN-HOUSE ONLY

Riverside Publishing Company, The. *California Program for Learning Assessment--Mathematics Performance Assessments*, 1994. Available from: The Riverside Publishing Company, 8420 Bryn Mawr Ave., Chicago, IL 60631, (800) 323-9540.

The *California Program for Learning Assessment* addresses language arts and mathematics in eight levels for grades 3-10. The math tests are designed to be given in 45 minutes and have two parts. Part 1 contains two open-ended math problems which take approximately 30 minutes to complete. Part 2 has seven multiple-step, multiple-choice problems which take approximately 15 minutes to complete. The test is designed to assess problem solving, application of knowledge, and communication skills rather than knowledge of specific facts or operations. The open-ended problems require written responses and are completed individually. Both open-ended and multiple-choice questions are thought-provoking.

Open-ended responses are scored using a 0-4 point, generalized, holistic rubric where "4" "Shows a complete understanding of the problem and addresses all relevant mathematical ideas. Exhibits sound reasoning and draws logical conclusions. Communicates clearly through the use of appropriate charts, graphs, diagrams, illustrations, and/or words. Provides computation (where required) adequate for the solution of the problem." Although somewhat sketchy, this rubric attempts to address the "big" outcomes in the NCTM standards. To help the scorer, the general rubric is tailored to each particular problem.

The materials we received mention a pilot test in 17 California schools, but no details are given.

(TC# 500.3CALPRL) IN-HOUSE USE ONLY

Riverside Publishing Company, The. *Performance assessments for ITBS, TAP and ITED [various levels and subject areas]*, 1993. Available from: The Riverside Publishing Company, 8420 Bryn Mawr Ave., Chicago, IL 60631, (800) 323-9540.

Riverside is publishing a series of open-response items in the areas of social studies, science, mathematics, and language arts. Nine levels are available for grades 1-12. They supplement achievement test batteries available from the publisher: ITBS, TAP, and ITED. Each level uses a scenario to generate a series of related questions, some of which have only one right answer, and others of which are more open-ended and generative. Tests take $1^1/_2$ to 2 hours depending on grade level.

No information about scoring, no sample student performances, and no technical information were included in the materials we received. However, the publisher's catalog indicates that scoring materials are available and that the tests are normed.

(TC# 060.3PERAST) IN-HOUSE USE ONLY

Romberg, Thomas A. *Assessing Mathematics Competence and Achievement*, 1989. Available from: National Center for Research in Mathematical Sciences Education, Wisconsin Center for Educational Research, University of Wisconsin, School of Education, 1025 W. Johnson St., Madison, WI 53706, (608) 263-4200.

This paper describes the author's view of what it means to be literate mathematically. It then describes the instructional and assessment implications of this goal. The author believes that we need to assess not only mathematical knowledge but also the structure of the knowledge.

(TC# 500.5ASSMAC)

Romberg, Thomas A. *The Domain Knowledge Strategy for Mathematical Assessment*, 1987. Available from: National Center for Research in Mathematical Sciences Education, Wisconsin Center for Educational Research, School of Education, 1025 W. Johnson St., Madison, WI 53706, (608) 263-4200.

This document provides a brief overview of the "Domain Knowledge" strategy used by the National Center for Research in Mathematical Sciences Education to assess math knowledge of students. This approach is contrasted to the typically used "Content by Behavior Matrix" approach in which content topics are crossed with behavior (usually some form of Bloom's taxonomy). The author maintains that this approach is outdated; the behavior dimension fails to reflect contemporary notions of how information is processed and the content dimension is an inadequate way to describe what is meant by "knowing mathematics."

The "Domain Knowledge" approach involves making a "map" or network of a concept domain. This reflects a more integrated and coherent picture about knowledge. These maps can be used to generate tasks, assessment criteria, and formats that get at both "correctness" of responses and the strategies used to arrive at the answer.

(TC# 500.6DOMKNS)

Romberg, Thomas A. ***Evaluation: A Coat of Many Colors*****, 1988. Available from: National Center for Research in Mathematical Sciences Education, Wisconsin Center for Educational Research, University of Wisconsin, School of Education, 1025 W. Johnson St., Madison, WI 53706, (608) 263-4200. Also located in: Mathematics Assessment and Evaluation: Imperatives for Mathematics Educators, Thomas A. Romberg (Ed.), 1992. Available from: State University of New York Press, State University Plaza, Albany, NY 12246.**

This paper describes the impact of assessment information on decision making and describes the ways in which assessment must change if it is to have a positive impact on such decisions.

(TC# 500.6EVACOM)

Romberg, Thomas A. ***Mathematics Assessment and Evaluation: Imperatives for Mathematics Educators*****, 1992. Available from: State University of New York Press, State University Plaza, Albany, NY 12246.**

This book covers several interesting topics with respect to assessment in math. Specifically:

1. How tests communicate what is valued
2. How current tests will not promote the recommendations in the NCTM standards
3. Various considerations when developing tests: calculators, how to adequately model knowledgeable students, etc
4. Setting up assessment that is intended to influence instruction

Although authoritative, this book is written in a very academic style, which makes it less accessible to general readers. Articles that are most relevant to this bibliography are entered separately.

(TC# 500.6MATASE)

Romberg, Thomas A., and Linda D. Wilson. ***Alignment of Tests with the Standards.*** **Located in: Arithmetic Teacher, September 1992, pp. 18-22.**

The authors make the argument that teachers teach to tests. Therefore, if we want the NCTM standards to be implemented we need to have tests that reflect the standards. The authors feel that many current norm-referenced tests do not match the standards. Finally, they present tasks from several innovative assessments that they feel do reflect the standards.

(TC# 500.6ALITEW)

Romberg, Thomas A., Linda D. Wilson, 'Mamphono Khaketla, et al. ***Curriculum and Test Alignment.*** **Located in: Mathematics Assessment and Evaluation: Imperatives for Mathematics Educators, Thomas A. Romberg (Ed.), 1992. Available from: State University of New York Press, State University Plaza, Albany, NY 12246.**

This article reports on two studies on the alignment of current standardized tests and alternative assessments to the NCTM standards. Results showed that current standardized tests are weak in five of six content and process areas, and place too much emphasis on procedures and not enough on concepts. The authors present several examples of test questions that they feel do match the standards.

(TC# 500.6CURTEA)

Romberg, Thomas A., E. Anne Zarinnia, and Steven R. Williams. ***The Influence of Mandated Testing on Mathematics Instruction: Grade 8 Teachers' Perceptions,*** **1989. Available from: National Center for Research in Mathematical Sciences Education, Wisconsin Center for Educational Research, School of Education, 1025 W. Johnson St., Madison, WI 53706, (608) 263-4200.**

This monograph reports on the first of a sequence of studies on mandated testing in mathematics. This study was a large-scale questionnaire survey to find out from Grade 8 teachers how influential mandated testing was on their teaching of mathematics. The results of the study showed that nearly 70 percent of the teachers reported that their students take a mandated test. Secondly, because teachers know the form and character of the tests their students take, most teachers make changes in their teaching to reflect this knowledge. Third, the kinds of changes teachers make are in contrast to the recommendations made by the NCTM standards. Specific examples are given.

Although this paper does not describe an alternative assessment device, it does provide reasons for seeking alternative ways of assessing math.

(TC# 500.6INFMAT)

Schoenfeld, Alan H. ***Teaching Mathematical Thinking and Problem Solving.*** **Located in: Toward the Thinking Curriculum: Current Cognitive Research, Loren B. Resnick & Leopold E. Klopfer (Eds.), 1989. Available from: Association for Supervision and Curriculum Development, 1250 N. Pitt St., Alexandria, VA 22314-1403, (703) 549-9110.**

Although this article is more about defining what mathematical problem solving is than about assessment, it presents an interesting visual way to represent how students spend their time when solving a problem. It also compares a plot of time use for a good problem solver to a plot for an inefficient problem solver.

Essentially, the plotting procedure involves tracking the sequence in which people use different steps in the problem-solving process (reading the problem, analyzing the problem,

exploring a solution strategy, planning, implementing a strategy, and verifying the results) and the amount of time spent on each. Good problem solvers spend a lot of time analyzing and planning, with many self-checks on "how it is going." Poor problem solvers tend to fixate on a possible line of attack and pursue it relentlessly even when it is clearly not going well. Additionally, there are very few stops to self-check on how it is going.

(TC# 500.5STOWTET)

Scottish Examination Board. ***Standard Grade - Revised Arrangements in Mathematics,*** **1987. Available from: Mr. K. Hutchon, Examination Officer, Ironmills Rd., Dalkeith, Midlothian, Edinburgh, Scotland, EH22 1LE, UK (031) 663-6601.**

The Scottish Examination Board prepares end-of-course tests for a variety of high school subjects to certify level of student competence. The course syllabus for mathematics calls for coverage of number, money, measurement, geometry, trigonometry, algebra, and graphs/tables. The goals of the course are: knowledge/understanding, reasoning/applications, and investigating. There are two main parts of the assessment in math--written tests (developed by the Examination Board) and performance assessments (conducted by teachers according to specifications developed by the Examination Board). The two parts are combined to rate student competence on a scale of 1-7 (1 being high), both overall and for each goal.

On-demand written tests, developed each year, cover knowledge/understanding and reasoning/applications. Three levels of the test are available: Foundation, General and Credit. Depending on the percent correct score, students can obtain ratings of 1 or 2 on the Credit level, 3 or 4 on the General level, and 5 or 6 on the Foundation level. All questions are short answer or multiple-choice and are scored for degree of correctness of the answer.

The hands-on performance assessments must cover a range of activities including: the identification and use of real data; the use of measuring or drawing instruments; the recognition or exploration of a pattern, conjecture, or proof; and the formulation of a mathematical model. Candidates write up their investigations in the form of a report. Performances are scored on "understanding and organizing the task," "carrying out the task," and "communication." A total of 12 marks (points) is available. General criteria for level designation are provided as well as the point conversions described above.

The package of materials we received included the course syllabus, specifications for the written and performance assessments, and copies of the written tests for 1993. It did not include technical information nor sample student responses.

(TC# 500.3MATSTG)

Semple, Brian. ***Assessment of Achievement Programme--Mathematics: Second Survey 1988.*** **Available from: Brian Semple, Principal Research Officer, New St. Andrews House, Room 4/51a, Edinburgh, Scotland EH1 3SY, UK (031) 244-4388.**

The "Assessment of Achievement Programme (AAP)" was established by the Scottish Office Education Department in 1981 to monitor the performance of pupils in grades 4, 7, and 9. The 1989 report "Mathematics: Second Survey 1988" reports on the 1988 mathematics assessment. The assessment covered geometry, algebra, estimation, and statistics (depending on grade level).

Assessment tasks used two formats: written and practical. However, the report we have does not describe these two formats, nor explain how responses were scored. Schools in the assessment sample were also invited to comment on their mathematics program.

The document we have includes the rationale for the assessment and description of student performance. No technical information is included.

(TC# 500.3ASSACP)

Semple, Brian McLean. ***Performance Assessment: An International Experiment*****, 1991. Available from: Educational Testing Service, The Scottish Office, Education Department, Rosedale Rd., Princeton, NJ 08541, (609) 734-5686.**

Eight math and eight science tasks were given to a sample of thirteen-year-olds in five volunteer countries (Canada, England, Scotland, USSR, and Taiwan). This sample was drawn from the larger group involved in the main assessment. The purpose of the assessment was to provide an information base to participating countries to use as they saw fit, and to examine the use of performance assessments in the context of international studies.

The 16 hands-on tasks are arranged in two 8-station circuits. Students spend about five minutes at each station performing a short task. Most tasks are "atomistic" in nature; they measure one small skill. For example, the 8 math tasks concentrate on measuring length, angles, and area, laying out a template on a piece of paper to maximize the number of shapes obtained, producing given figures from triangular cut-outs, etc. Some tasks require students to provide an explanation of what they did. All 16 tasks are included in this document, although some instructions are abbreviated and some diagrams are reduced in size. the complete tasks, administration and scoring guides are available from ETS.

Most scoring is right/wrong; student explanations are summarized by descriptive categories. There is also observation of the products of students' work.

Student summary statistics on each task are included. There is a brief summary of teacher reactions, student reactions, the relationship between student performance on various tasks, and the relationship between performance on the multiple-choice and performance portions of the test. A few sample student performances are included.

(For related information, see Nancy Mead, also listed in this bibliography.)

Shoecraft, Paul. *MOVE IT Math Concepts 1*, 1988-1992. Available from: Mathematics Education Initiative, University of Houston-Victoria, 2506 E. Red River, Victoria, TX 77901, (512) 576-3151.

The *MOVE IT Math Concepts 1* and *MOVE IT Math Levels of Use Questionnaire* together form a two-pronged assessment strategy to promote the implementation of Level 1 of the *MOVE IT* math program. *MOVE IT* math is a K-6, university-supported professional development program that advocates mathematics instruction based on the use of manipulatives to address a wide variety of learning styles (e.g., visual, auditory, kinesthetic). It consists of three half-hour inservices (Level 1 is one of the three).

The *Math Concepts 1* assessment instrument is a constructed response, paper-and-pencil test of the concepts of (1) equals as balanced, (2) exchanging "up" in base ten, (3) being an exchanging expert, and (4) exchanging "down" in base ten. A measurement item involving adding feet and inches is included to assess ability to take into account the context in which numbers appear.

Copies of the Concepts 1 test, answers, and test results from six years of use are available. They may be used as it or modified, with appropriate citation to the authors.

Silver, Edward A., and Jeremy Kilpatrick. *Testing Mathematical Problem Solving*. Located in: The Teaching and Assessing of Mathematical Problem Solving, Randall Charles and Edward Silver (Eds.), 1988. Available from: National Council of Teachers of Mathematics, Inc., 1906 Association Dr., Reston, VA 22091.

This paper discusses two topics: how assessment can inform instructional decision making and how it communicates what we value. The authors propose that the National Assessment of Educational Progress and many other math tests do not provide the type of information needed for the improvement of mathematics instruction. The information useful for improvement of instruction would be types of errors kids make, how automatic mathematical processes are, and the cognitive structures and abilities associated with expertise in the domain being tested.

Stenmark, Jean Kerr. ***Mathematics Assessment: Myths, Models, Good Questions, and Practical Suggestions*****, 1991. Available from: National Council of Teachers of Mathematics, 1906 Association Dr., Reston, VA 22091.**

This monograph was designed for teachers in the elementary grades. It is a collection of examples of assessment techniques that focus on student thinking. Topics include the rationale for new ways of assessing mathematics, the necessity of integrating assessment and instruction, designing performance assessments (most emphasis is on designing the task, although sample holistic and analytical trait scoring systems are shown), what to look for during classroom observations and interactions (including questions to ask to get at various types of thinking), portfolios (including types of items to include and the types of information they can demonstrate about students, and criteria for evaluation), student self-assessment, and hints to make assessment work in the classroom. No technical information is provided.

Stuart Foundations Project Teachers. ***Language Arts and Science Performance Assessment Sampler, 1993.*** **Available from: San Diego City Schools, 4100 Normal St., Room 3133, San Diego, CA 92103, (619) 298-8120.**

This document includes 12 performance assessment project tasks developed by teachers for students in grades K-3 and 4-8. Some of the tasks are interdisciplinary (science, math, writing,) and some are subject specific (mostly writing). The tasks themselves are interesting and may provide ideas for others developing performance assessments. This document does not include rationale or context for the tasks, technical information, or sample student work. The performance criteria listed for each project are sketchy.

Surber, John R. ***Mapping as a Testing and Diagnostic Device*****, 1984. Located in: Spatial Learning Strategies--Techniques, Applications, and Related Issues, C. D. Holley & D. F. Dansereau (Eds.). Available from: Academic Press, 1250 6th Ave., San Diego, CA 92101.**

The book is a general discussion of the advantages of, and procedures for, integrating the production of cognitive networks into instruction. The premise is that knowledge of facts, rules, algorithms, etc. is only part of what students need to know. They also need to know how these facts fit together to form a body of knowledge. Without knowledge of the interrelationships, students are not likely to remember the facts or be able to use them correctly when they are remembered.

The Surber paper discusses a particular type of cognitive networking scheme--mapping--and its use in assessment of knowledge structures. The basic procedure consists of taking a completed map for the topic to be tested, and deleting portions in various ways. Students then complete the map given various types of cues.

(TC# 000.6MAPASA)

Surber, John R., Philip L. Smith, Frederika Harper. ***MAP Tests*****, 1981 - undated. Available from: John R. Surber, University of Wisconsin-Milwaukee, Department of Educational Psychology, Milwaukee, WI 53201, (414) 229-1122.**

Our review is based on four reports from the author: *Testing for Misunderstanding* (John R. Surber and Philip L. Smith, Educational Psychologist, 1981, 16, 3, pp. 165-174; *Technical Report No. 1, Structural Maps of Text as a Learning Assessment Technique: Progress Report for Phase I;* Surber, Smith, and Frederika Harper, undated, University of Wisconsin-Milwaukee; *Technical Report No. 6, The Relationship Between Map Tests and Multiple Choice Tests,* Surber, Smith and Harper, 1982, University of Wisconsin-Milwaukee; and *Mapping as a Testing and Diagnostic Device,* Surber: Spatial Learning Strategies, 1984, Academic Press, Inc., pp. 213-233 (also available as TC# 000.6MAPASA).

These reports and papers describe the development of map tests as an assessment technique to identify conceptual misunderstandings that occur when students learn from text. The purpose is to diagnose student understanding in order to plan instruction. In this testing technique, the test developer graphically represents concepts and their interrelationships in a map. Then, information from the map is systematically removed. Students complete the map shells. Four different levels of deletion associated with different types of content clues are described. Maps are scored by comparing the student-completed version to the original. Scoring involves looking both at the content included or omitted from the map and the proper relationship between this content. Report #6 describes scoring in more detail.

The authors did a series of studies on this technique, reported on in "Mapping as a Testing and Diagnostic Device." They found good interrater reliability and good consistency between developers of "master maps." They report on comparisons to multiple-choice tests.

Text maps and tests can be constructed in any content area at any grade level. The specific examples in these materials come from chemistry (matter), study skills, and sociology (the development of early warfare).

A manual, designed to teach students how to construct concept maps, is included in Report #1. The authors have given educators permission to copy these documents for their own use.

(TC# 150.6MAPTES)

Thompson, Linda. *Portfolio Model*, undated. Available from: Linda Thompson, Chief Moses Junior High School, 2215 Westshore Dr., Moses Lake, WA 98837, (509) 766-2661.

The author is experimenting with the use of portfolios in her seventh grade math classes. Students are asked to included in their portfolio at least one entry for each of: mathematics as problem solving, mathematics as communication, mathematics as reasoning, mathematics connections, estimation, number sense and numeration, concepts of whole number operations, whole number computation, geometry and spatial sense, measurement, statistics/probability, fractions and decimals, patterns and functions. A single entry might serve to illustrate more than one skill. Thus, the portfolio is designed to align with the NCTM standards.

The packet of materials includes the direction sheets for students, two sample cover sheets that could be used for each portfolio entry, a self/peer rating sheet for group cooperation, a list of required content for a parent conference portfolio, and the student version of a scoring guide for individual portfolio entries. The latter scoring guide is holistic and uses a four-point scale. "4" is: "This response provides proof that you really understand the mathematical concepts you are demonstrating. You have communicated your understanding so well there is no question that you have mastered the ideas being explored." Thus, students appear to be scored only on conceptual understanding and communication; the packet contains no scoring guides for other areas such as problem solving, reasoning or connections.

The packet also does not include technical information nor sample student work. The author has given permission for educators to copy the materials for their own use.

Webb, Noreen. ***Collaborative Group Versus Individual Assessment in Mathematics: Processes and Outcomes - CSE Technical Report 352*****, March 1993. Available from: Center for Research on Evaluation, Standards, and Student Testing (CRESST), University of California, Los Angeles, CA 90024, (310) 206-1532.**

The author reports on a study designed to determine the extent to which information from group tasks can be used to make inferences about the abilities of individual students, and also determine what additional information about student skills is provided from group tasks.

The study used 53 seventh grade students who worked in small groups to calculate the costs of long distance phone calls. Two weeks later students worked individually on a similar problem. Work was scored on nine dimensions, e.g., "recognizes that call has multiple minutes," and "applies single cost to each additional minute." The nature of individual student behavior in the group was also analyzed, e.g., students (1) solved the problems correctly aloud with little or no assistance from others, and (2) expressed difficulty with the problems (made errors or asked questions indicating that they were confused).

Results showed that: (1) students working in groups showed uniformly high levels of performance; (2) some lower-achieving students did better when assessed individually than would be predicted from pretest scores, but only in cases when they used the resources of the group to understand the procedures; (3) however, in general, there was a large discrepancy between individual and group performance; (4) analyzing the group process skills of individual students shed considerable light on individual student understanding and on their collaborative skills; (5) students learn more from the group experience if they have been taught how to work productively in teams.

Webb, Norman, and Thomas A. Romberg. *Implications of the NCTM Standards for Mathematics Assessment.* Located in Mathematics Assessment and Evaluation: Imperatives for Mathematics Educators, Thomas A. Romberg (Ed.), 1992. Available from: State University of New York Press, State University Plaza, Albany, NY 12246.

This paper provides a good summary of the NCTM standards, both goals for students and standards for assessment. It uses four of the standards for assessment to develop criteria for assessments:

1. The assessment instrument should provide information that will contribute to decisions for the improvement of instruction.
2. The assessment instruments should be aligned with the instructional goals, the goals for the overall program, and a holistic conceptualization of mathematical knowledge.
3. The assessment instruments should provide information on what a students knows.
4. The results from one assessment instrument should be such that when combined with results from other forms of assessment, a global description is obtained of what mathematics a person or group knows.

The authors then illustrate their points with several assessment tasks that they feel would elicit the correct behavior from students. (These generally have only one correct answer and appear to be scored for degree of correctness.)

Webb, Norman L. and Arthur F. Coxford, Eds. *Assessment in the Mathematics Classroom, 1993 Yearbook*, 1993. Available from: The National Council of Teachers of Mathematics, Inc., 1906 Association Dr., Reston, VA 22091.

This book contains a number of papers that discuss classroom assessment in grades K-12. Specific topics include student self-assessment, assessing problem solving, EQUALS, NCTM standards, and integrating assessment and instruction.

(TC# 500.6ASSMAC)

Whetton, Chris. *Key Stage 1, 1993, Teacher's Pack*, 1993. Available from: HMSO Publications Centre, PO Box 276, London SW8 5DT, England, UK.

This document contains all administration materials for the 1993 assessment. The assessments consist of a combination of hands-on and paper-and-pencil activities for primary students. English, science and mathematics are covered. In science and math, some activities are scored for the correctness of the answer and some are scored for correctness of approach or explanation. For example, one math task consisted of adding and subtracting using a small

number of objects. (The student must get three out of four correct to be scored as "pass.") One science task has students draw pictures or verbally explain what forces are acting on a raft as it floats on the water. (Responses are scored correct if the student conveys the knowledge that there are forces acting down and up on the raft.) Scoring is always tied directly to the task, and tasks usually are designed to cover discrete skills or pieces of knowledge.

All tasks are administered by the classroom teacher in large and small group settings. Results of the 1993 administration are not yet available, so it is unknown how long the most current version takes. (The 1993 assessment was greatly streamlined from the 1992 assessment which took 24 hours, including English.)

(TC# 070.3KEY193)

Wilson, Mark. ***Measuring Levels of Mathematical Understanding.*** **Located in: Mathematics Assessment and Evaluation: Imperatives for Mathematics Educators, Thomas A. Romberg (Ed.), 1992. Available from: State University of New York Press, State University Plaza, Albany, NY 12246.**

The premise of this article is that if we want students to be reasoners and thinkers, we need to move from tests that fragment knowledge into "atomistic" pieces, each of which are assessed independently of the others, to assessment procedures that reveal student understanding of the concepts in a domain and their interrelationships. Many current tests are based on lists of skills, each of which is tested separately. "The primary focus of a mathematics testing methodology based on an active, constructive view of learning is on revealing how individual students view and think about key concepts in a subject. Rather than comparing students' responses with a 'correct' answer to a question so that each response can be scored right or wrong, the emphasis is on understanding the variety of responses that students make to a question and inferring from those responses students' levels of conceptual understanding."

The author presents a few examples. One is the SOLO taxonomy which looks at degree of formal reasoning. *(See the Collis-Romberg TC# 500.3COLROM on this bibliography.)*

This is a very technical and theoretical article and points up the need to be well grounded in current theory before beginning to develop math assessments.

Zarinnia, E. Anne, and Thomas A. Romberg. ***A Framework for the California Assessment Program to Report Students' Achievement in Mathematics.*** **Located in: Mathematics Assessment and Evaluation: Imperatives for Mathematics Educators, Thomas A. Romberg (Ed.), 1992. Available from: State University of New York Press, State University Plaza, Albany, NY 12246.**

This paper takes the position that assessment affects instruction, and therefore, regardless of the other purposes for the assessment, the instructional implications of our assessments must be taken into account. "If one acknowledges student learning as the central mission of schooling, it further suggests that not only the tasks, but also the system and structures for gathering accountability information and reporting the data, should be designed with instructional needs in mind."

Other points made by this paper are:

1. We need to change the view of math held by many teachers and the general public, that math is a set of rules and formalisms invented by experts that everyone else is to memorize. The authors maintain that both the test itself and the way results are reported will influence these perceptions.

2. Mathematical power means that citizens can use math to solve day-to-day problems. This means we need to seek evidence of students using, reflecting on, and inventing mathematics in the context of value and policy judgments. These experiences should be built into our instruction and assessments.

Implications for turning power over to students are also discussed.
